Contents

CONTENTS

CONTENTS

Foreword

This book contains a selection of 1000 quotes from IEEE Software[1]. IEEE Software is a leading software engineering magazine with a very rich history. Since 1984, many of the leading software engineering professionals have contributed to IEEE Software. The content is based on the material from the IEEE Software history website[2]. Visit this site to find more details about IEEE Software and its history.

Selected quotes are not intended to serve as a comprehensive overview of the history of software engineering. Rather, the book is designed as a "coffee table book". It is intended for casual reading, offering interesting, educative, thought-provoking, and sometimes controversial quotes.

PREMIERE ISSUE
JANUARY 1984

“Many of the **challenges facing the software industry** today are a direct result of our **insatiable appetite** for new computer-based systems applications. Others confront us simply because we have not managed to successfully solve a large number of **problems that we ourselves created many years ago**.”

---

*Bruce D. Shriver, **From the Editor-in-Chief**, IEEE Software, January 1984.*[3]

[3] DOI: 10.1109/MS.1984.233385

"There probably isn't a best way to build the system or even a major part of it. Much more important is to **avoid choosing a terrible way** and to **have a clear division of responsibilities** among the parts."

Butler W. Lampson, ***Hints for Computer System Design***, *IEEE Software, January 1984.*[4]

[4] DOI: 10.1109/MS.1984.233391

“Designing a computer system is very **different from designing an algorithm**: … the requirement - is less precisely defined more complex, and more subject to change; the system has much more internal structure - hence, many internal interfaces; and the measure of success is much less clear. The designer usually finds himself flondering in a sea of possibilities, unclear about how one choice will limit his freedom to take other choices or affect the size and performance of the entire-system.”

Butler W. Lampson, ***Hints for Computer System Design****, IEEE Software, January 1984.*[5]

[5] DOI: 10.1109/MS.1984.233391

“Booch offers a software design methodology, which he calls ‘**object-oriented design**’ in contrast to earlier popular methods he designates as either **functional** or **data-oriented**. In contrast to suggestions that we either identify a program’s principal function and describe it in the top box in a hierarchy chart or carefully identify the patterns of data and their flows, Booch suggests, ‘Define the problem, develop an informal strategy; formalize the strategy.’”

Peter G. Anderson, ***Review of Grady Booch’s book ‘Software Engineering with Ada’****, IEEE Software, January 1984.*[6]

MARCH 1985

Specifications

Make thee an ark of gopher wood; rooms shalt thou make in the ark, and shalt pitch it within and without with pitch.

And this is the fashion which thou shalt make it of: the length of the ark shall be three hundred cubits, the breadth of it fifty cubits, and the height of it thirty cubits.

A window shalt thou make to the ark, and in a cubit shalt thou finish it above; and the door of the ark shalt thou set in the side thereof; with lower, second, and third stories shalt thou make it.

“In essence, **programming-in-the large** involves the two complementary activities of modularization and interface control. **Modularization** is the identification of the major system modules and the entities those modules contain, where entities are language elements that are given names, such as subprograms, data objects, and types. **Interface control** is the specification and control of the interactions among entities in different modules.”

Alexander L. Wolf, Lori A. Clarke, Jack C. Wileden, ***Ada-Based support for programming-in-the-Large****, IEEE Software, March 1985.*[13]

[13] DOI: 10.1109/MS.1985.230352

“Engineers may be able to design a **better interface** if they take into account the **control structures** underlying the **interface syntax**.The **syntactic**, **semantic**, and **protocol** aspects of the interface each have their **own ‘complexity.’**.”

Reusing
Software

"**Reusing** and **reworking** software is not new; it has been done since the very beginnings of our industry in the early 1950s. Reuse means using an entity in a different context from that in it initially had been used. This is often called **'black-box' reuse**. When an entity is modified before it is used in the new setting, it is called 'rework' or **'white-box' reuse**."

“In our haste to **speed development**, we should consider if we are sprinting in the right direction. Is faster time-to-market equally important to every developer? Does a **faster cycle time** necessarily guarantee success? And how does the answer change from one year to the next?”

David N. Card, ***Guest Editor’s Introduction: The RAD Fad–Is Timing Really Everything?****, IEEE Software, September 1995.*[184]

[184] DOI: 10.1109/MS.1995.10045

“To be successful with RAD (**rapid application development**), we can no longer look just at the software product in isolation. A RAD development process demands that we expand our view to **encompass users** and their work environments-and if we do it right, everyone benefits. But given all the risks, would you stake **mission-critical projects on RAD**? If it is not mission-critical, then why bother at all?”

Erran Carmel, John P. Reilly, ***Point-Counterpoint: Does RAD Live Up to the Hype?****, IEEE Software, September 1995.*[185]

[185] DOI: 10.1109/52.406752

“Earl Wheeler told me …: ‘The key thrust … was delegating power down. It was likemagic! **Improved quality**, **productivity**, **morale**. We have **small teams**, with **no central control**. The **teams own the process**, but they have to haveone. They have many different processes. They **own the schedule**, but they **feel the pressure** of the market. This pressure causes them to reach for tools on their own’.”

Frederick P. Brooks Jr., ***The Mythical Man-Month: After 20 Years***, *IEEE Software, September 1995.*[186]

[186] DOI: 10.1109/MS.1995.10041

"The **Mythical Man-Month** is **only incidentally about software** but **primarily about how people in teams make things**.There is surely some truth in this; in the preface to the 1975 edition I said that managing a software project is more like other management than most programmers initially believe. I still believe that to be true. Human history is a drama in which the stories stay the same, the scripts of those stories change slowly with evolving cultures, and the stage settings change all the time. So it is that we see our twentieth-century selves mirrored in Shakespeare, Homer,and the Bible."

Frederick P. Brooks Jr., ***The Mythical Man-Month: After 20 Years****, IEEE Software, September 1995.*[187]

[187] DOI: 10.1109/MS.1995.10041

“At **Hitachi Software**, we organize software projects in a way that retains high-quality software and improves scheduling. We do this by **forcing ‘necessary’ conflicts** among independent groups within the larger software-development team. We believe that by creating **a competitive atmosphere** between **the design and quality-assurance departments**, engineers on both teams are motivated to be quality sensitive.”

Akira K. Onoma, Tsuneo Yamaura, ***Practical Steps Toward Quality Development****, IEEE Software, September 1995.*[188]

[188] DOI: 10.1109/52.406760

“What are the three most important things to remember when you buy a house? Most real estate agents have a simple answer: **location**, **location**, **location**. And what are the three most important things to remember when attempting software-process improvement? My answer: **people**, **people**, **people**.”

"The **consequences of Moore's Law** for IEEE Software are significant. In short, in the coming decades, we will see technological and market niches that constantly form, shift, merge, split, and disappear. **Computers** will **permeate most of our buildings** (homes and offices), **cars**, **wallets**, **watches**, maps, and credit cards. Existing devices (faxes, phones, PCs, TVs, GPSs, pagers, PDAs, and the like) will merge into forms that are specialized to particular uses (the so-called 'convergence revolution')."

Ted J. Biggerstaff, ***Moore's Law: Change or Die****, IEEE Software, January 1996.*[194]

[194] DOI: 10.1109/MS.1996.476277

“If you are a software developer, manager, or maintainer, quality is often on your mind. But **what do you really mean by software quality**? Is your definition adequate? Is the software you produce better or worse than you would like it to be?”

Shari Lawrence Pfleeger, Barbara Kitchenham, ***Software Quality: The Elusive Target****, IEEE Software, January 1996.*[195]

[195] DOI: 10.1109/52.476281

“Discussions of **software quality** typically **focus on** the development **process** or the characteristics of the software **product**. The third level of quality - **the outcome** of software development - is usually neglected, although this is perhaps of greatest interest to business management. **Outcome** depends on how the product is used and determines **the business value** obtained from the development project.”

Pamela Simmons, ***Quality Outcomes: Determining Business Value****, IEEE Software, January 1996.*[196]

[196] DOI: 10.1109/52.476283

“Today the dominant modus operandi for software development is **heavily process-oriented** … the **emphasis on process** … comes at the expense of … using adequate **product quality models**. The fundamental axiom of software product quality is: … tangible **internal characteristics** … determine its external quality attributes. … A **product quality model** … must … identify the tangible (measurable and/or assessable) **internal** product **characteristics** that have the most significant effect on external quality attributes. “

R. Geoff Dromey, ***Cornering the Chimera***, *IEEE Software*, *January 1996.*[197]

[197] DOI: 10.1109/52.476284

"In 1991, **Philips' CEO** named a **Software Process Improvement task force** to focus on the increasing importance of software … In addition to improving its processes, the organization improved its requirements-and-design engineering architecture and its **inspections**, and it **introduced metrics**."

Hans Aerts, Jan Rooijmans, Michiel Van Genuchten, ***Software Quality in Consumer Electronics Products****, IEEE Software, January 1996.*[198]

[198] DOI: 10.1109/52.476286

“The goals of consistent design can be clarified by a look at early **user interface design for automobiles**. Early automobile designers offered their own distinct designs for a profusion of controls. Some designs, such as a brake that was too far from the gas pedal, were dangerous. There was also a consistency issue. If your brake was to the left of the gas pedal and your neighbor’s car had the reverse design, it might be risky to trade cars. Achieving good design and appropriate consistency in automobiles took half a century. Let’s hope we can make the transition faster for Web-search user interfaces.”

BUILDING THE COMMUNITY OF LEADING SOFTWARE PRACTITIONERS

SEPTEMBER/OCTOBER 2001

Benchmarking: Learning from the Masters

IEEE COMPUTER SOCIETY

http://computer.org

“Margaret Boden … identifies basic **types of creative processes**: **exploratory creativity** explores a possible solution space and discovers new ideas, **combinatorial creativity** combines two or more ideas that already exist to create new ideas, and **transformational creativity** changes the solution space to make impossible things possible. Most requirements engineering RE activities are exploratory. “

Alexis Gizikis, Neil Maiden, ***Where Do Requirements Come From?****, IEEE Software, September 2001.*[343]

[343] DOI: 10.1109/52.951486

"Focus on **building an environment** that will **keep your engineers** … Give them **rewarding assignments**, build cohesive and **committed teams**, and know what each of them is doing. Then, every week if possible, show that you appreciate their efforts."

Watts S. Humphrey, ***Engineers Will Tolerate a Lot of Abuse****, IEEE Software, September 2001.*[344]

[344] DOI: 10.1109/52.951487

“Whether you are **benchmarking** an organization or simply a project, it all boils down to **one thing—data**. Do you have the necessary data in your company, and is that data valid and comparable?”

Katrina D. Maxwell, ***Collecting Data for Comparability: Benchmarking Software Development Productivity****, IEEE Software, September 2001.*[345]

[345] DOI: 10.1109/52.951490

“In 1999, an organization contributed a large group of enhancement projects to the **International Software Benchmarking Standards Group’s Data Repository**. The contributing organization received an individual benchmark report for each project, comparing it to the most relevant projects in the repository. … The benchmarking exercise aimed to provide valuable information to the organization and to measure the benchmarking exercise’s effectiveness given the **repository’s anonymous nature**.”

Peter R. Hill, Michael Stringer, Chris Lokan, Terry Wright, ***Organizational Benchmarking Using the ISBSG Data Repository****, IEEE Software, September 2001.*[346]

[346] DOI: 10.1109/52.951491

“Most commercial software producers **guard access to the source code** of their systems, making it difficult for anyone outside their organizations to apply a variety of measures that could potentially improve system security. But since an attacker could also examine public source code to find flaws, would source code access be a net gain or loss for security? … having **source code available** should on balance work **in favor of system security**.”

---

“Where **design counts** is often not in how the software runs but in **how easy it is to change**. When how it runs is important, **ease of change** can be the biggest factor in ensuring good performance. This drive toward changeability is why it’s so important for a design to **clearly show** what the program does—and how it does it. After all, it’s hard to change something when you **can’t see** what it does.”

---

*Martin Fowler, **To Be Explicit**, IEEE Software, November 2001.*[349]

[349] DOI: 10.1109/52.965796

"**Extreme Programming** XP is not the ultimate silver bullet that offers an answer to all development problems. But it has **gained significant momentum** and an increasing number of software teams are ready to give it a try."

Wolfgang Strigel, ***Guest Editor's Introduction: Reports from the Field–Using Extreme Programming and Other Experiences***, *IEEE Software, November 2001.*[350]

[350] DOI: 10.1109/MS.2001.965797

“The **SW-CMM** focuses on both the **management issues** … **XP**, on the other hand, is a specific **set of practices**—a ‘methodology’—that is effective in the context of small, colocated teams with rapidly changing requirements. **Taken together**, the two methods can create **synergy**, particularly in conjunction with other good engineering and management practices. “

Mark C. Paulk, ***Extreme Programming from a CMM Perspective****, IEEE Software, November 2001.*[351]

[351] DOI: 10.1109/52.965798

“All programmers **learn from experience**. A few are rather fast at it and learn to avoid repeating mistakes after once or twice. Others are slower and repeat mistakes hundreds of times. Most programmers’ behavior falls somewhere in between: They reliably **learn from their mistakes**, but the process is **slow and tedious**. The probability of making a structurally similar mistake again decreases slightly during each of some dozen repetitions. Because of this a programmer often takes years to learn a certain rule—positive or negative—about his or her behavior. “

Lutz Prechelt, ***Accelerating Learning from Experience: Avoiding Defects Faster****, IEEE Software, November 2001.*[352]

"In **real archaeology**, you're investigating some situation, trying to understand what you're looking at and how it all fits together. To do this, you must be careful to **preserve the artifacts** you find and **respect and understand** the cultural forces that produced them. … **Code** becomes legacy code just about as soon as it's written, and suddenly we have exactly the **same issues as the archaeologists**: What are we looking at? How does it fit in with the rest of the world? And what were they thinking?"

Dave Thomas, Andy Hunt, ***Software Archaeology****, IEEE Software, March 2002.*[357]

[357] DOI: 10.1109/52.991327

“The real departure for **Web-based enterprise applications** is the possibility of **wide-ranging accessibility**. A system that might be deployed in-house at a manufacturing company can now be deployed to all the dealers of that manufacturer’s products. Indeed, it can be deployed to all the customers.”

Martin Fowler, Elizabeth Hendrickson, ***The Software Engineering of Internet Software: Guest Editors’ Introduction****, IEEE Software, March 2002.*[358]

[358] DOI: 10.1109/MS.2002.991328

"In **only four or five years**, the **world wide web** has changed from a **static collection** of HTML web pages to a **dynamic engine** that powers e-commerce, collaborative work, and distribution of information and entertainment. … Web sites that depend on **unreliable software** will **lose customers**, and the businesses could lose much money. Companies that want to do business over the Web must spend resources to ensure high reliability. Indeed, they cannot afford not to."

Jeff Offutt, ***Quality Attributes of Web Software Applications****, IEEE Software, March 2002.*[359]

[359] DOI: 10.1109/52.991329

"Relatively **few design principles** are required to **design scalable systems** … : **divide and conquer** (D&C), **asynchrony**, **encapsulation**, **concurrency**, **parsimony**."

Colleen Roe, Sergio Gonik, ***Server-Side Design Principles for Scalable Internet Systems****, IEEE Software, March 2002.*[360]

[360] DOI: 10.1109/52.991330

“Despite breathless declarations that the Web represents a new paradigm defined by new rules, professional developers are realizing that **lessons learned** in the **pre-Internet days** of software development **still apply**. Web pages are user interfaces, HTML programming is programming, and browser-deployed applications are software systems that can **benefit from basic software engineering principles**.”

Larry L. Constantine, Lucy A.D. Lockwood, ***Usage-Centered Engineering for Web Applications****, IEEE Software, March 2002.*[361]

[361] DOI: 10.1109/52.991331

"Many current **Web technologies** lend themselves to **bad practices**, including **cut-and-paste** reuse, **ad-hoc scripts**, **direct-to-database code**, and **fragmented business logic**. Good design practices are increasingly important in Web development … a **Model-View-Controller** … framework lets developers focus on writing application code instead of dealing with servlets, requests, or session variables."

---

*Alan Knight, Naci Dai, **Objects and the Web**, IEEE Software, March 2002.*[362]

[362] DOI: 10.1109/52.991332

"How to **test output from the server** is another classic problem because of the nature of Web applications. How do you test HTML? Certainly we don't want tests that assert that the output is some **long string of HTML**. … Testing the Web page look is not usually the goal; **testing the data in the output** is. Any **slight change** to the output—for example, a cosmetic change such as making a word appear in red—**should not break an output test**."

Robert Mee, Edward Hieatt, ***Going Faster: Testing The Web Application****, IEEE Software, March 2002.*[363]

Software Inspection

http://computer.org

IEEE COMPUTER SOCIETY

“Despite more than 30 years’ effort to improve software quality, companies still release programs containing **numerous errors**. Many major products have **thousands of bugs**. It’s not for lack of trying; all major software developers stress software quality assurance and try to remove bugs before release. The problem is the **code’s complexity**. It’s easy to review code but **fail to notice significant errors**.”

David L. Parnas, Mark Lawford, ***Guest Editors’ Introduction: Inspection’s Role in Software Quality Assurance****, IEEE Software, July 2003.*[406]

[406] DOI: 10.1109/MS.2003.1207449

"**Reading techniques** must specifically address delocalization–the distribution of related functionality throughout an object-oriented system–and the fact that the **static (compile time)** and **dynamic (run time) views** of an object-oriented system are **largely distinct**."

Marc Roper, Alastair Dunsmore, Murray Wood, ***Practical Code Inspection Techniques for Object-Oriented Systems: An Experimental Comparison****, IEEE Software, July 2003.*[407]

[407] DOI: 10.1109/MS.2003.1207450

"Principles from **software inspection**, **use cases**, and operational profile testing are combined into the **usage-based reading** technique. The goal is to provide an efficient reading technique for software inspections, which takes the user viewpoint on the software and the faults it might contain. The user reads, for example, a design document guided by **prioritized use cases**. An experimental evaluation shows that the UBR method is **more effective** and efficient in finding **faults, critical to the user**, compared to checklist-based methods."

Claes Wohlin, Thomas Thelin, Per Runeson, ***Prioritized Use Cases as a Vehicle for Software Inspections****, IEEE Software, July 2003.*[408]

[408] DOI: 10.1109/MS.2003.1207451

"**Software inspection** reduces the number of defects early in the software life cycle. **Cost savings** are realized because errors are significantly more expensive to eliminate with each successive development phase. An important part of the inspection process is a detailed inspection of the source code …. Recent advances in research on **static program analysis** can be used to address this aspect of **software inspection**."

Paul Anderson, Tim Teitelbaum, Thomas Reps, Mark Zarins, ***Tool Support for Fine-Grained Software Inspection****, IEEE Software, July 2003.*[409]

[409] DOI: 10.1109/MS.2003.1207453

"We can divide software systems architecturally along two broad dimensions. The first is the **tarchitecture** or '**technical architecture**' and the second is the **marketecture** or '**marketing architecture**.' I refer to the traditional software architect or chief technologist as the **tarchitect** and the product-marketing manager, business manager, or program manager responsible for the system as the **marketect**."

Luke Hohmann, ***The Difference between Marketecture and Tarchitecture****, IEEE Software, July 2003.*[410]

[410] DOI: 10.1109/MS.2003.1207454

"Let's allow SE programs to **hire the best-qualified candidates** regardless of whether they've acquired a PhD."

"I think that one of an **architect's** most important **tasks** is to remove architecture by finding ways to **eliminate irreversibility** in software designs."

Martin Fowler, ***Who Needs an Architect?****, IEEE Software, September 2003.*[412]

[412] DOI: 10.1109/MS.2003.1231144

"**Model-driven development** is simply the notion that we can construct a **model of a system** that we can then **transform into the real thing**."

Anthony N. Clark, Takao Futagami, Stephen J. Mellor, ***Guest Editors' Introduction: Model-Driven Development****, IEEE Software, September 2003.*[413]

[413] DOI: 10.1109/MS.2003.1231145

"The potential benefits of **using models** are significantly greater in **software** than in **other engineering disciplines** because of the potential for a seamless link between models and the systems they represent. Unfortunately, models have **rarely produced anticipated benefits**. The key lies in **resolving pragmatic issues** related to the artifacts and culture of the previous generation of software technologies."

Bran Selic, ***The Pragmatics of Model-Driven Development****, IEEE Software, September 2003.*[414]

[414] DOI: 10.1109/MS.2003.1231146

"A **model** is a **set of statements** about some **system under study**. Here, **statement** means some expression about the SUS that can be considered **true or false** (although no truth value has to necessarily be assigned at any particular point in time). We can use a model **to describe** an SUS. In this case, we consider the model **correct** if all its statements are true for the SUS. … Alternatively, we can use a **model as a specification** for an SUS or a class of SUS. In this case, we consider a specific SUS **valid** relative to this specification if no statement in the model is false for the SUS. "

---

*Ed Seidewitz, **What Models Mean**, IEEE Software, September 2003.*[415]

[415] DOI: 10.1109/MS.2003.1231147

“**UML** can be used in **many formats**, including presented as **text**, parsed into a **standardized repository**, and **compiled** to multiple programming languages.”

"In a **criminal trial** (at least in the US), the **failure to follow** an established **best practice** in an investigation could result in an **acquittal**. … the **American Society for Quality's definition** probably comes closest to what we in software development mean when we use the term. The ASQ defines 'best practice' as a **superior method** or innovative practice that contributes to the improved performance of an organization, usually **recognized** as 'best' **by other peer** organizations."

Warren Harrison, ***From the Editor: Best Practices–Who Says?****, IEEE Software, January 2004.*[423]

[423] DOI: 10.1109/MS.2004.1320864

"'We resolve to **keep all** program design **documentation** complete, precise, and **up to date**'. - David Lorge Parnas"

Nancy Leveson, Barry Boehm, Shari Lawrence Pfleeger, Nancy R. Mead, Elaine Weyuker, Al Davis, Watts S. Humphrey, David Lorge Parnas, Victor R. Basili, John D. Musa, ***New Year's Resolutions for Software Quality****, IEEE Software, January 2004.*[424]

[424] DOI: 10.1109/MS.2004.1259165

“When you dig into the knowledge base of experience, you find the following **seven best practices** for **outsourcing** common to reported successes in the literature … **Never** outsource a **core competency** … Establish **win-win conditions** with your suppliers … **Nurture your relationships** with your suppliers … **Measure** performance as **quantitatively** as possible … Make **exceptional performance** financially worthwhile … Treat outsourcing as a **technology transfer** opportunity …”

---

*Donald J. Reifer, **Seven Hot Outsourcing Practices**, IEEE Software, January 2004.*[425]

[425] DOI: 10.1109/MS.2004.1259166

“This month, the column looks at how to **ruin a software project** in just **three easy steps**. … (1) **Don’t bother to check** if the code is doing what you think it’s doing (2) **Never let go** of code … (3) Whether you are compiling, testing, creating a release, or doing end-user product installation, **do it differently every time**. … Fortunately, three simple practices can **save a project** from these and other common mishaps: **version control**, **unit testing**, and **automation**.”

Dave Thomas, Andy Hunt, ***Three Legs, No Wobble****, IEEE Software, January 2004.*[426]

[426] DOI: 10.1109/MS.2004.1259177

"The open source movement is affecting software development products and processes. … Process integration and the **coevolution of multiple open source and proprietary projects** are still open problems."

Clemens Szyperski, *Diomidis Spinellis*, ***Guest Editors' Introduction: How Is Open Source Affecting Software Development?***, *IEEE Software*, *January 2004.*[427]

[427] DOI: 10.1109/MS.2004.1259204

“**Many** software development methodologies **are called ‘open source.’** However simply stating that a project is open source **doesn’t precisely describe** the approach used to support the project.”

Budi Arief, Cristina Gacek, ***The Many Meanings of Open Source****, IEEE Software, January 2004.*[428]

[428] DOI: 10.1109/MS.2004.1259206

“Mission operators at **NASA’s Jet Propulsion Laboratory** use Science Activity Planners to analyze data acquired by rovers and direct their activities. In designing the SAP for the **Mars Exploration Rovers** project, developers **relied** heavily **on open source** components. They found that using open source software components not only helped keep the project within budget but also resulted in a **more robust and flexible** tool.”

Jeffrey S. Norris, Poul-Henning Kamp, ***Mission-Critical Development with Open Source Software: Lessons Learned****, IEEE Software, January 2004.*[429]

[429] DOI: 10.1109/MS.2004.1259211

“The importance of changing the mindset in relation to the new support paradigm implied by **open-source software** (OSS) is also significant. By and large, reliance on a standard maintenance contract isn’t an option, and bulletin boards might be the main source of support. Thus, it is hardly surprising that support from top management is critical. Also, even though OSS may be available at little or no cost, organizations should not expect maintenance and support to be available at a lesser cost than would apply for commercial software. Indeed, OSS represents a good opportunity for small software companies all around the world to treat it as **an infrastructure component**, like the highway or telecommunications lines, and then use it as a bootstrap to build a service and support business model on top.”

Tony Kenny, Brian Fitzgerald, ***Developing an Information Systems Infrastructure with Open Source Software****, IEEE Software, January 2004.*[430]

[430] DOI: 10.1109/MS.2004.1259216

"Any company dealing with **OSS** needs a **few simple rules** for using it in product development: Control the introduction and use of OSS; it must be **explicitly authorized** on a per-version basis. Disseminate **technical**, **managerial**, and **legal** information widely in your company. Systematically qualify OSS components before integrating them."

Christof Ebert, Michel Ruffin, ***Using Open Source Software in Product Development: A Primer****, IEEE Software, January 2004.*[431]

[431] DOI: 10.1109/MS.2004.1259227

“**Outsourcing**, overseas development, and **foreign workers displacing American ones**: These are all interesting issues, but in a sense they’re all **so ‘last century.’** Or are they?”

---

*Robert L. Glass, **Sources for Software Development: A Mugwumpish View**, IEEE Software, January 2004.*[432]

“**Software changes** are a lot **like rain**. While a **few drops** here and there usually **aren’t** that much of a **problem**, a **steady downpour** can be **damaging**—and a deluge can wipe out everything you’ve carefully built. “

---

*Maarten Boasson, Terry Bollinger, Jeffrey Voas, **Persistent Software Attributes**, IEEE Software, November 2004.*[458]

[458] DOI: 10.1109/MS.2004.46

"In contemporary societies, **individuals** and **organizations** increasingly **depend on** services delivered by sophisticated **software**-intensive systems. **Dependability** has become a key **systems property**, which needs to be engineered and guaranteed regardless of continuous, rapid, and unpredictable technological and context changes."

Paolo Donzelli, Victor Basili, Sima Asgari, ***A Unified Model of Dependability: Capturing Dependability in Context****, IEEE Software, November 2004.*[459]

[459] DOI: 10.1109/MS.2004.30

“If you don’t carefully and accurately **manage customizations** … the result can be **skyrocketing development costs**, poor customer support, and an inability to respond quickly to new needs.”

Sonia Calzada, Ismael Ciordia, Fernando Alonso, Nicol? Serrano, ***Automated Management of Multicustomer Code Bases****, IEEE Software, November 2004.*[460]

[460] DOI: 10.1109/MS.2004.35

"If **developers** are willing to **work hard** and carefully **introduce an agile process** into their organization, their efforts should yield **positive results**."

David Noftz, Rekha Raghu, Jerry Drobka, ***Piloting XP on Four Mission-Critical Projects****, IEEE Software, November 2004.*[461]

[461] DOI: 10.1109/MS.2004.47

"**Routine tasks** are the easiest ones for programmers to **avoid**. So, to develop a single program—even a program with only one file — it's common to have a script that compiles it with the desired options and executes it with some arguments. When your project has hundreds or thousands of files and a large team of developers, the script isn't a utility, but a necessity; it becomes even more critical when the project's structures are complicated and the dependencies are hard to remember."

Ismael Ciordia, Nicol? Serrano, ***Ant: Automating the Process of Building Applications****, IEEE Software, November 2004.*[462]

[462] DOI: 10.1109/MS.2004.33

"Many software projects involve **at least one stakeholder who secretly wants the project to fail**. Finding this stakeholder can be difficult but is important to ensuring the project's success."

Johann Rost, ***Political Reasons for Failed Software Projects***, *IEEE Software, November 2004.*[463]

Test-Driven Development

MAY | JUNE 2007

IEEE computer society

www.computer.org/software

"The **architecture** of a software-intensive system is largely **irrelevant to its end users**. Far more important to these stakeholders is the **system's behavior**, exhibited by raw, working source code. As long as a system provides the right answers at the right time with all the right other '-ilities' (maintainability, dependability, changeability, and so on), end users couldn't care less about what's behind the curtain making things work. To stakeholders other than end users, however, a system's architecture is intensely interesting. Moreover, software architecture has had a hand in **better project management**, greater use of **iterative development**, and leverage from the **Web's infrastructure**."

---

*Grady Booch, **The Irrelevance of Architecture**, IEEE Software, May 2007.*[561]

[561] DOI: 10.1109/MS.2007.93

"Knowing what tactic to take when someone **criticizes your design** is important. Designers need to recognize, accept, and **seek out valid criticism**, while **deflecting false criticisms** and **defusing aesthetic arguments**."

Rebecca J. Wirfs-Brock, ***Handling Design Criticism****, IEEE Software, May 2007.*[562]

[562] DOI: 10.1109/MS.2007.76

"**Test-driven development** is a discipline of design and programming where every line of new **code is written in response to a test** the programmer writes just before coding. … The ways TDD is being used in nontrivial situations (database development, embedded software development, GUI development, performance tuning), signifying an adoption level for the practice beyond the visionary phase and into the early mainstream."

Grigori Melnik, Ron Jeffries, ***Guest Editors' Introduction: TDD–The Art of Fearless Programming****, IEEE Software, May 2007.*[563]

[563] DOI: 10.1109/MS.2007.75

“A professional software developer ships **clean**, **flexible** code that **works-on time**. … **Test-driven development** is a discipline that helps developers behave in a more professional manner.”

---

*Robert C. Martin, **Professionalism and Test-Driven Development**, IEEE Software, May 2007.*[564]

[564] DOI: 10.1109/MS.2007.85

"Developers can use a **test-driven development** with **database schema** just as they use it with application code. Implementing test-driven database development (TDDD) involves three relatively simple steps: database **refactoring**, database **regression testing**, and **continuous** database **integration**."

Scott W. Ambler, ***Test-Driven Development of Relational Databases***, *IEEE Software, May 2007.*[565]

[565] DOI: 10.1109/MS.2007.91

“An explanation of test-driven development often begins by describing the **red-green-refactor** cycle. This slogan is so catchy and the description so simple that practitioners and tool developers tend to focus only on this **localized cycle**. Experience has shown that a successful functional test-driven development strategy must **span the entire application life cycle** and must be supported by effective tools. “

Software Patterns

JULY | AUGUST 2007

IEEE computer society

www.computer.org/software

“Cognitive biases exist, and designers are remiss if we ignore them. By becoming aware of some common **cognitive biases in design discussions**, you can learn when it’s worthwhile to tweak your message to increase the likelihood of it being accepted.”

Rebecca J. Wirfs-Brock, ***Giving Design Advice***, *IEEE Software, July 2007.*[567]

[567] DOI: 10.1109/MS.2007.108

“**A domain-specific language** for building user interfaces offers a transparent way for programmers to specify interface elements. **Microsoft’s Extensible Application Markup Language** is an XML dialect for this purpose. However, **XAML** isn’t the only choice for programmers who wish to try a declarative approach, and some options are even open source.”

Panagiotis Louridas, ***Declarative GUI Programming in Microsoft Windows****, IEEE Software, July 2007.*[568]

[568] DOI: 10.1109/MS.2007.105

“Virtually all **well-structured music**, music that pleases the ear and moves the spirit, is **full of patterns**. By comparing musical and software patterns, the author helps clarify the purposes and forms of patterns. Architectural and design patterns make software-intensive systems easier to understand and adapt to because of their **regularity and simplicity**.”

---

*Grady Booch, **The Well-Tempered Architecture**, IEEE Software, July 2007.*[569]

[569] DOI: 10.1109/MS.2007.122

"**Patterns** have become part of the **software development mainstream**. They're available for all phases of the development process, including analysis, documentation, design, testing, and configuration management, to name a few."

Michael Kircher, Markus Völter, ***Guest Editors' Introduction: Software Patterns****, IEEE Software, July 2007.*[570]

[570] DOI: 10.1109/MS.2007.109

“For the past two decades, **software patterns** have significantly influenced how developers design and implement computing systems, well above and **beyond the most popular research** in the software field. “

Douglas C. Schmidt, Kevlin Henney, Frank Buschmann, ***Past, Present, and Future Trends in Software Patterns****, IEEE Software, July 2007.*[571]

[571] DOI: 10.1109/MS.2007.115

“All of software design involves developers **making decisions** and reifying those decisions in code. … However, architects often **fail to document** their decisions well. This leads to **architectural erosion**: decisions made during later development might conflict with the original architectural decisions and thus cause significant system disruptions. “

Neil B. Harrison, Uwe Zdun, Paris Avgeriou, ***Using Patterns to Capture Architectural Decisions****, IEEE Software, July 2007.*[572]

[572] DOI: 10.1109/MS.2007.124

"**Microsoft's patterns & practices** group conducted a survey that indicates a **significant gap** between the patterns **expert community** and the **software practitioners** attempting to use and leverage patterns in their daily work."

Jason Hogg, Dragos Manolescu, Wojtek Kozaczynski, Ade Miller, ***The Growing Divide in the Patterns World****, IEEE Software, July 2007.*[573]

[573] DOI: 10.1109/MS.2007.120

"**Researchers** have studied and created a wide range of techniques to **support software engineers** during development. … there's a high demand and acceptance for **unobtrusive**, **quickly** executable, and reactive **assistance** in core software engineering phases to help solve the problems at hand."

Eric Ras, Jörg Rech, Björn Decker, ***Intelligent Assistance in German Software Development: A Survey****, IEEE Software, July 2007.*[574]

[574] DOI: 10.1109/MS.2007.110

"**Asimov's Laws of Robotics** constrain robots to serve their human masters. Minor rewording shows that similar principles are very **relevant to software too**. These **laws of software** encompass a host of desiderata and trade-offs that software developers need to keep in mind. They also demonstrate that issues that are typically treated in a fragmented manner are actually strongly intertwined."

Dror G. Feitelson, ***Asimov's Laws of Robotics Applied to Software***, *IEEE Software, July 2007.*[575]

BUILDING THE COMMUNITY OF LEADING SOFTWARE PRACTITIONERS

Software

Dynamically Typed Languages

SEPTEMBER/OCTOBER 2007

IEEE computer society

www.computer.org/software

"Building and acquiring software requires making **many decisions** and choosing between numerous solutions, yet the infrastructure to help people make decisions **based on good evidence** isn't well developed. The software engineering community needs better communication between researchers and practitioners to help make **useful bodies of evidence** available that can impact practice."

---

*Forrest Shull, **Who Needs Evidence, Anyway?**, IEEE Software, September 2007.*[576]

[576] DOI: 10.1109/MS.2007.152

“Since 2005, developers have used **Ajax** to let users interact with Web applications much as they do with desktop applications. But the **Ajax** features represented in applications such as **Google Maps**, **Netvibes**, and Zimbra Collaboration Suite demand detailed coding. **Ajax frameworks** are utility sets that make it easier to develop and maintain these applications.”

Juan Pablo Aroztegi, Nicolás Serrano, ***Ajax Frameworks in Interactive Web Apps****, IEEE Software, September 2007.*[577]

[577] DOI: 10.1109/MS.2007.132

"Building **clean abstractions** with **clearly defined extension points** is satisfying, but the best design choice isn't always obvious. How much access should you give a subclass to a class's inner workings? How much freedom should you give a subclass designer to 'bend' inherited behaviors to make a new abstraction fit in or to extend an existing one? These decisions involve nuanced reasoning. The contract between a class and its subclasses requires **thoughtful design**, **experimentation**, and **careful specification**."

---

*Rebecca J. Wirfs-Brock, **Designing Extensible Classes**, IEEE Software, September 2007.*[578]

[578] DOI: 10.1109/MS.2007.137

"**The architect**, either as an individual, a role, or a team, lovingly crafts, grows, and governs that architecture as it emerges from the **thousands of individual design decisions** of which it's composed. In this sense, an **architecture-first approach** appears to be a reflection of sound development practices."

---

*Grady Booch, **The Economics of Architecture-First**, IEEE Software, September 2007.*[579]

[579] DOI: 10.1109/MS.2007.146

"**Copy-pasting** code is a source of bugs. By employing in our programs **abstraction mechanisms** such as **functions**, **classes**, **types**, **decision tables**, **domain-specific languages**, and databases, we can abstract common elements into **parameterized reusable functionality**. However, **abstraction has its cost**. Its early gains are large, but eventually the benefits turn negative and the code becomes less comprehensible and maintainable. Deciding when abstracting is appropriate is what makes programming an art."

Diomidis Spinellis, ***Abstraction and Variation****, IEEE Software, September 2007.*[580]

[580] DOI: 10.1109/MS.2007.127

"**The languages** discussed … have a long history, which is perhaps why some have had **several different names** over the years. One such language is **Lisp**, the second-oldest programming language. For years, many somewhat dismissively described languages such as Lisp as '**scripting languages**.' Today, we more commonly refer to them as **dynamically typed languages**, typified by **Python and** Ruby, **and** their impact is arguably greater than ever."

Roel Wuyts, Laurence Tratt, ***Guest Editors' Introduction: Dynamically Typed Languages****, IEEE Software, September 2007.*[581]

[581] DOI: 10.1109/MS.2007.140

“Five years ago, the team at Reflexis ran into **a little language from Brazil**. Lua (pronounced loo-ah) changed the way they work profoundly. It lets them create hybrid solutions that combine the strengths of **statically typed software** with the flexibility of a **dynamically typed environment**. In short, with Lua, they get the best of both worlds. Lua can help you become more productive by extending your **C/C++** creations with the expressive power and flexibility of a dynamically typed language.”

Quality Requirements

MARCH/APRIL 2008

IEEE computer society
www.computer.org/software

“**Measuring** software development **productivity** is difficult, but it’s not impossible. It’s prone to misuse and misinterpretation, and highly portable, precise measures are elusive. But we can still implement meaningful measures, provided we understand why we’re doing it and provided we’re aware of their limitations.”

Hakan Erdogmus, ***Measurement Acquiescence****, IEEE Software, March 2008.*[596]

[596] DOI: 10.1109/MS.2008.40

"As the code written today becomes part of tomorrow's inexorably **growing legacy**, preserving these stories becomes increasingly important. It's costly to rely upon informal **storytelling** to **preserve** and **communicate important decisions**; it's incredibly costly to try to recreate those decisions and their rationale when the storytellers themselves are gone. Insofar as a software development organization can **preserve** its stories in a system's written architecture, it can make evolving that system materially easier."

---

*Grady Booch, **Tribal Memory**, IEEE Software, March 2008.*[597]

[597] DOI: 10.1109/MS.2008.52

"When dealing with **quality requirements**, you often end up in difficult **trade-off analysis**. You must take into account aspects such as **release** targets, **end-user experience**, and **business opportunities**. At the same time, you must consider what is **feasible** with the evolving system architecture and the available development resources. Our experience from the mobile-phone domain shows that much can be gained if development team members **share** a common **framework of quality indicators** and have a **simple**, easy-to-use model for reasoning about quality targets."

Richard Berntsson Svensson, Björn Regnell, Thomas Olsson, ***Supporting Roadmapping of Quality Requirements****, IEEE Software, March 2008.*[598]

[598] DOI: 10.1109/MS.2008.48

"**Test-driven development** (TDD) is first and foremost a design practice. The question is, 'How good are the resulting designs?' … TDD programmers tend to write software modules that are **smaller**, **less complex**, and more **highly tested** than modules produced by their test-last counterparts. However, the results didn't support claims for lower coupling and increased cohesion with TDD."

David Janzen, Hossein Saiedian, ***Does Test-Driven Development Really Improve Software Design Quality?****, IEEE Software, March 2008.*[599]

[599] DOI: 10.1109/MS.2008.34

“The **Business Process Execution Language** specifies Web services that work together to perform a business process. BPEL is an **orchestrating language**: it sets down exactly how the Web services will cooperate to carry out the overall business process. BPEL is an **XML-based programming language** - that is, you write BPEL programs in XML. Because XML wasn’t designed with programmers in mind, the programming results aren’t prime examples of elegance. Fortunately, you rarely need to write in BPEL by hand. Most BPEL programs are written using **special graphical editors** that let you describe the business process diagrammatically and then automatically generate the corresponding BPEL code.”

Panagiotis Louridas, ***Orchestrating Web Services with BPEL****, IEEE Software, March 2008.*[600]

[600] DOI: 10.1109/MS.2008.42

[626] DOI: 10.1109/MS.2008.135

"**Static analysis** examines code in the **absence of input data** and **without running the code**. It can detect potential **security violations** (SQL injection), **runtime errors** (dereferencing a null pointer) and **logical inconsistencies** (a conditional test that can't possibly be true). … **FindBugs**, an open source static-analysis tool for Java … evaluates what kinds of defects can be effectively detected with relatively simple techniques and helps developers understand how to incorporate such tools into software development."

Nathaniel Ayewah, John Penix, J. David Morgenthaler, William Pugh, David Hovemeyer, ***Using Static Analysis to Find Bugs****, IEEE Software, September 2008.*[627]

[627] DOI: 10.1109/MS.2008.130

"**Refactoring tools** can **improve** the **speed and accuracy** with which developers create and maintain software - but only **if they are used**. In practice, tools are not used as much as they could be; this seems to be because sometimes they do not align with the refactoring tactic preferred by most programmers, a tactic the authors call 'floss refactoring.' They propose five principles that characterize successful floss-refactoring tools—principles that can help programmers to choose the most appropriate refactoring tools and also help toolsmiths to design tools that fit the programmer's purpose."

Emerson Murphy-Hill, Andrew P. Black, ***Refactoring Tools: Fitness for Purpose****, IEEE Software, September 2008.*[628]

[628] DOI: 10.1109/MS.2008.123

“**Over time**, software systems suffer gradual **quality decay** and therefore costs can rise if organizations fail to take **proactive countermeasures**. Quality control is the first step to avoiding this cost trap. **Continuous quality assessments** help users identify quality problems early, when their removal is still inexpensive; they also aid decision making by providing an integrated view of a software system’s current status. As a **side effect**, continuous and timely feedback helps developers and maintenance personnel **improve** their **skills** and thereby decreases the likelihood of future quality defects. To make regular quality control **feasible**, it must be **highly automated**, and assessment results must be presented in an aggregated manner to **avoid overwhelming users** with data. “

Florian Deissenboeck, Stefan Wagner, Markus Pizka, Benjamin Hummel, Elmar Juergens, Benedikt Mas y Parareda, ***Tool Support for Continuous Quality Control****, IEEE Software, September 2008.*[629]

[629] DOI: 10.1109/MS.2008.129

"Design teams rarely **consider multiple solution ideas** before committing to one. They often forget that an even better idea could be just around the corner, and consider alternative ideas only when they don't like the current one. Using **sketchboarding**, design studio, or a combination of these two techniques can let teams quickly ideate over many solutions. They then have a chance to arrive at a solution that no one individual had thought of."

---

*Jeff Patton, **Consider Multiple Solutions**, IEEE Software, September 2008.*[630]

[630] DOI: 10.1109/MS.2008.134

“**Software resource estimation** methods and models have had a major impact on successful software engineering practice. They provide milestone budgets and schedules that help projects determine when they are making **satisfactory progress** and when they need **corrective action**. They help decision makers analyze **software cost-schedule-value trade-offs** and make decisions regarding investments, outsourcing, COTS products, and legacy software phaseouts. They help organizations **prioritize investments** in improving software productivity, quality, and time to market. “

Ricardo Valerdi, Barry W. Boehm, ***Achievements and Challenges in Cocomo-Based Software Resource Estimation****, IEEE Software, September 2008.*[631]

[631] DOI: 10.1109/MS.2008.133

"Despite various industry reports about the **failure rates** of software projects, there's still **uncertainty** about the **actual figures**. Researchers performed a global Web survey of IT departments in 2005 and 2007. The results suggest that the software **crisis is perhaps exaggerated** and that most software projects deliver. However, the overall project failure rate, including cancelled and completed but poorly performing projects, remains arguably high for an applied discipline."

Khaled El Emam, A. Günes Koru, ***A Replicated Survey of IT Software Project Failures****, IEEE Software, September 2008.*[632]

[632] DOI: 10.1109/MS.2008.107

“Software developers often need to understand a large body of **unfamiliar code** with little or **no documentation**, **no experts** to consult, and **little time** to do it. … The most common suggestions were to use a **code navigation tool**, use a **design recovery** tool, use a **debugger** to step through the code, create a **runtime trace**, use problem-based learning, ask people for help, study the code from top down, and **print out all** the code.”

Sukanya Ratanotayanon, Susan Elliott Sim, ***Inventive Tool Use to Comprehend Big Code****, IEEE Software, September 2008.*[633]

[633] DOI: 10.1109/MS.2008.118

“Every new line of code quickly becomes **legacy**. When that **legacy** mounts, it forms a significantly massive pile of software, which cannot be ignored. … what we can do intentionally with such piles, from **abandonment** to **evolution** and many **things in between**.”

Opportunistic System Development

25 YEARS

NOVEMBER|DECEMBER 2008

Celebrating 25 Years of *IEEE Software*:
A 25-Year History of Software Milestones

IEEE computer society

www.computer.org/software

"In the world of **user-centered design** thinking, **Alan Cooper** is responsible for many of the tenets used in **interaction design practice** today. Most notably, he introduced the use of **personas** to distill and make relevant information about a system's users, information we subsequently use to drive interaction design."

Jeff Patton, ***A Conversation with Alan Cooper: The Origin of Interaction Design****, IEEE Software, November 2008.*[636]

[636] DOI: 10.1109/MS.2008.142

"Over the **past 25 years**, we've made **great advances** in tooling, technologies, and techniques that make software **design** more concrete. But **design** still **requires careful thought**."

---

*Grady Booch, **Back to the Future**, IEEE Software, November 2008.*[637]

[637] DOI: 10.1109/MS.2008.144

“Many major **technology breakthroughs** happened **before 1984**: Milestones such as the **IBM OS/360** and **the microprocessor**, and even many still-relevant software engineering practices, had been developed much earlier. So what makes the recent 25 years unique? First, software **moved** from a few company desks to the lives of practically **everyone on the planet**. The **PC**, the **Internet**, and **mobile phones** showcase this tremendous evolution. Second, empirical evaluations overcame opinions. Mary Shaw described the eighties by stating, ‘Software engineering is not yet a true discipline, but it has the potential to become one.’ In those early days, a lot of technologies were just assembled and delivered, but from the ’80s onward, engineers evaluated and empirically assessed new technologies to **judge their impact**.”

Christof Ebert, ***A Brief History of Software Technology***, *IEEE Software, November 2008.*[638]

[638] DOI: 10.1109/MS.2008.141

“Today’s **power tools** enable us to **cut code** and **test** our **design ideas** much more quickly. This is a significant improvement. Yet the **more code** we create, the more opportunity we have for it to **grow** unwieldy, inconsistent, and **unmaintainable**. “

---

*Rebecca J. Wirfs-Brock, **Designing Then and Now**, IEEE Software, November 2008.*[639]

[639] DOI: 10.1109/MS.2008.146

"The increasing sophistication and use of **software measurement** over the past 25 years … highlights **four obstacles** to more effective use of measurement: dealing with **uncertainty**, anticipating **change**, measuring '**soft**' characteristics, and developing **heuristics**."

Shari Lawrence Pfleeger, ***Software Metrics: Progress after 25 Years?***, *IEEE Software, November 2008.*[640]

[640] DOI: 10.1109/MS.2008.160

"**Opportunistic software systems development** (OSSD) is an approach in which developers **meld together** software pieces that they have found. Most often they find unrelated software **components** and systems that **weren't designed to work together** but that provide functionality they want to include in a new system. Typically, in opportunistic development, developers spend less effort developing software functionality to meet particular requirements and more time developing '**glue code**' and using other techniques for integrating the various software pieces."

Anatol W. Kark, Cornelius Ncube, Patricia Oberndorf, ***Opportunistic Software Systems Development: Making Systems from What's Available****, IEEE Software, November 2008.*[641]

[641] DOI: 10.1109/MS.2008.153

"Developing products and services pragmatically places requirements on the **relationship** between the software **developer** and the **third-party functionality** provider."

Sjaak Brinkkemper, Slinger Jansen, Cetin Demir, Ivo Hunink, ***Pragmatic and Opportunistic Reuse in Innovative Start-up Companies****, IEEE Software, November 2008.*[642]

[642] DOI: 10.1109/MS.2008.155

"**Situated software**, a type of opportunistic software, is created by a small subset of users to fulfill a specific purpose. For example, business users have been creating situated software through mashups, which combine data from multiple sources on internal systems or the Internet."

Grace A. Lewis, Soumya Simanta, Dennis B. Smith, Sriram Balasubramaniam, ***Situated Software: Concepts, Motivation, Technology, and the Future****, IEEE Software, November 2008.*[643]

[643] DOI: 10.1109/MS.2008.159

"Using **opportunistic software development principles** in **computer engineering education** encourages students to be creative and to develop solutions that cross the boundaries of diverse technologies."

Dragan Gaševic, Željko Obrenovic, Anton Eliëns, ***Stimulating Creativity through Opportunistic Software Development****, IEEE Software, November 2008.*[644]

"Few software practices are as important as testing, and **testing techniques** are amenable to measurement and reasoning about their effectiveness. Because they're aimed at **removing faults**, measuring the number and type of such removed faults seems like a natural part of applying these techniques."

Ana Moreno, Sira Vegas, Natalia Juristo, Forrest Shull, ***A Look at 25 Years of Data****, IEEE Software, January 2009.*[645]

[645] DOI: 10.1109/MS.2009.2

“Becoming a **better designer** means getting better at what we do now while not getting lulled into accepting the status quo. To stay effective as designers, we need to **continue** to **learn**, **adapt**, keep an **open mind**, and work to **perfect our craft**.”

---

*Rebecca J. Wirfs-Brock, **Designing in the Future**, IEEE Software, January 2009.*[646]

[646] DOI: 10.1109/MS.2009.7

"Today, many software projects are **geographically distributed**, so software managers must know how to manage **distributed teams**. For example, they need to know how to build teams across sites, how to break down and distribute tasks, how to share knowledge across time, space, and cultural differences, and how to coordinate work to produce coherent outcomes."

Lars Mathiassen, John Stouby Persson, ***A Process for Managing Risks in Distributed Teams****, IEEE Software, January 2009.*[647]

[647] DOI: 10.1109/MS.2009.157

"Modern programming environments automatically collect lots of data on software development, notably changes and defects. The field of **mining software archives** is concerned with the **automated extraction**, **collection**, and **abstraction** of information from this data."

Andreas Zeller, Nachiappan Nagappan, Thomas Zimmermann, ***Guest Editors' Introduction: Mining Software Archives****, IEEE Software, January 2009.*[648]

[648] DOI: 10.1109/MS.2009.14

"**Software archives** such as source code **version-control systems** and **issue-tracking systems** (for bugs and change requests) are rich sources to examine what changes have what impact on the software."

Harald C. Gall, Martin Pinzger, Beat Fluri, ***Change Analysis with Evolizer and ChangeDistiller****, IEEE Software, January 2009.*[649]

[649] DOI: 10.1109/MS.2009.6

"In 1994, **Standish** published **the Chaos report** that showed a shocking 16 percent project success. This and renewed figures by Standish are often used to indicate that project management of application software development is in trouble. However, **Standish's definitions** have four **major problems**. First, they're **misleading** because they're based solely on estimation accuracy of cost, time, and functionality. Second, their estimation accuracy measure is **one-sided**, leading to unrealistic success rates. Third, **steering** on their definitions **perverts good estimation** practice. Fourth, the resulting figures are **meaningless** because they **average** numbers with an **unknown bias**, numbers that are introduced by **different underlying estimation** processes."

Chris Verhoef, J. Laurenz Eveleens, ***The Rise and Fall of the Chaos Report Figures****, IEEE Software, January 2009.*[650]

[650] DOI: 10.1109/MS.2009.154

"As **software's impact** and influence grows, so do the **possibilities for innovation** and increasing the competitive advantage through software."

Steven Kunsman, Samuel Fricker, Kenneth Palm, Tony Gorschek, ***A Lightweight Innovation Process for Software-Intensive Product Development****, IEEE Software, January 2009.*[651]

[651] DOI: 10.1109/MS.2009.164

"Mining software repositories using **analytics-driven dashboards** provides a **unifying mechanism** for **understanding**, **evaluating**, and **predicting** the development, management, and economics of large-scale systems and processes. Dashboards enable **measurement** and **interactive graphical displays** of complex information and support flexible analytic capabilities for user customizability and extensibility."

Richard W. Selby, ***Analytics-Driven Dashboards Enable Leading Indicators for Requirements and Designs of Large-Scale Systems****, IEEE Software, January 2009.*[652]

[652] DOI: 10.1109/MS.2009.4

"Developers should **factor rework into sizing** and productivity calculations when estimating software effort. **Reworked code** is software created during development that **doesn't exist** in the **final build**. Using lines of code as a sizing metric is helpful when estimating projects with similar domains, platforms, processes, development teams, and coding constraints."

Edmund Morozoff, ***Using a Line-of-Code Metric to Understand Software Rework****, IEEE Software, January 2009.*[653]

[653] DOI: 10.1109/MS.2009.160

“**Software-intensive systems**, like bridges and societies, are subject to **collapse**. Collapse isn’t necessarily inevitable, however, but avoiding it requires active, vigorous, and intentional intervention by the system’s architects.”

Capturing Design Knowledge

MARCH | APRIL 2009

IEEE Celebrating 125 Years of Engineering the Future
IEEE computer society
www.computer.org/software

"At the core of **cloud computing** is a simple concept: **software as a service**, or SaaS. Whether the underlying software is an **application**, application **component**, **platform**, **framework**, **environment**, or some other soft infrastructure for composing applications to be delivered as a service on the Web, it's all software in the end. But the **simplicity ends** there. Just a step away from that core, a **complex concoction** of paradigms, concepts, and technologies envelop cloud computing."

Hakan Erdogmus, ***Cloud Computing: Does Nirvana Hide behind the Nebula?****, IEEE Software, March 2009.*[656]

[656] DOI: 10.1109/MS.2009.31

“Given that useful knowledge in software engineering has a half-life of about five years, **reading** remains **an excellent way** to replenish this vanishing resource for the diligent software engineer.”

---

*Philippe Kruchten, **You Are What You Read**, IEEE Software, March 2009.*[657]

[657] DOI: 10.1109/MS.2009.55

"**Successful** software-intensive systems are generally quite **innovative**, as evidenced by their success. Although their architectures will, over time, converge to a stable point, this does not mean that innovation stops. Rather, for any such system to remain vibrant and relevant, **innovation must proceed** simultaneously at many levels."

---

*Grady Booch, **The Resting Place of Innovation**, IEEE Software, March 2009.*[658]

[658] DOI: 10.1109/MS.2009.53

"**Capturing** software **design knowledge** is important because it tends to evaporate as software systems evolve. This has severe consequences for many software projects. To counteract this phenomenon, effective, systematic **documentation** of design knowledge is important."

Uwe Zdun, ***Guest Editor's Introduction: Capturing Design Knowledge****, IEEE Software, March 2009.*[659]

[659] DOI: 10.1109/MS.2009.37

"**Large software systems**, developed over several years, are the backbone of industries such as banking, retail, transportation, and telecommunications. With multiple bug fixes and feature enhancements, these systems gradually deviate from the intended architecture and deteriorate into **unmanageable monoliths**."

Madhu K. Iyengar, Saravanan Sivagnanam, K. Rangarajan, Shubha Ramachandran, G. Sathish Kumar, Santonu Sarkar, ***Modularization of a Large-Scale Business Application: A Case Study****, IEEE Software, March 2009.*[660]

[660] DOI: 10.1109/MS.2009.42

"**A decision view** provides a useful complement to the traditional sets of architectural views and viewpoints. It gives an explanatory perspective that illuminates the **reasoning process** itself and not solely its results. The decision view documents **aspects** of the architecture that are **hard to reverse-engineer** from the software itself and that are often left tacit."

Philippe Kruchten, Juan Carlos Dueñas, Rafael Capilla, ***The Decision View's Role in Software Architecture Practice****, IEEE Software, March 2009.*[661]

[661] DOI: 10.1109/MS.2009.52

"We rarely see the **traditional way** of software development in which one company handles design, production, sales, delivery, and service. Business models, engineering life cycles, distribution channels, and services have changed dramatically. A key driver in these new value networks is **open source software** (OSS). Worldwide companies in various industries have invested in open source. Market leaders such as Google, IBM, Microsoft, SAP, and Siemens as well as many small companies turn to OSS for multiple reasons."

Christof Ebert, ***Guest Editor's Introduction: How Open Source Tools Can Benefit Industry****, IEEE Software, March 2009.*[662]

[662] DOI: 10.1109/MS.2009.38

"A **software forge** is a tool platform for **collaborative software development**, similar to integrated CASE environments. Unlike CASE tools, however, software forges have been designed for the software development practices of the **open source community**."

Dirk Riehle, Tamir Menahem, Barak Naveh, John Ellenberger, Boris Mikhailovski, Yuri Natchetoi, Thomas Odenwald, ***Open Collaboration within Corporations Using Software Forges****, IEEE Software, March 2009.*[663]

[663] DOI: 10.1109/MS.2009.44

“Developing **complex software** can be difficult no matter how good designers get at architecture, tooling, or technology. Although agile techniques and practices vary, successful agile designers I know are **passionate about** producing **high-quality** incremental design solutions. “

"**Superprofessionalism** is a mode of conduct characterized by seven central traits: focus on **individual responsibility**, acute **awareness**, commitment to **facts**, **resilience** under pressure, sense of **fairness**, attention to detail in **perspective**, and **pragmatism** first."

Hakan Erdogmus, ***The Seven Traits of Superprofessionals****, IEEE Software, July 2009.*[666]

[666] DOI: 10.1109/MS.2009.107

"**Simple architectures** have **conceptual integrity** and are better than more complex ones. Continuous architectural refactoring helps to converge a system to its practical and optimal simplicity."

Grady Booch, ***The Defenestration of Superfluous Architectural Accoutrements***, *IEEE Software, July 2009.*[667]

[667] DOI: 10.1109/MS.2009.105

“Compliance to a professional society’s **code of ethics** carries obligations beyond minimum standards of behavior. Members of software engineering professional societies should also serve the **public interest** and promote the common good.”

Duncan Hall, ***The Ethical Software Engineer***, *IEEE Software*, *July 2009.*[668]

[668] DOI: 10.1109/MS.2009.106

"A **framework** for **thinking about** domain-specific languages (**DSLs**) divides them into **internal DSLs**, **external DSLs**, and **language workbenches**. In all cases, it's important to have an explicit semantic model so that they form a veneer over an underlying library. DSLs are valuable for increasing programmer **productivity** and improving **communication** with domain experts."

Martin Fowler, ***A Pedagogical Framework for Domain-Specific Languages****, IEEE Software, July 2009.*[669]

[669] DOI: 10.1109/MS.2009.85

"**Domain-specific techniques** provide a high-level specification for software systems. The technology's foundations have been developed over the last few years. However, domain-specific techniques **aren't a panacea**, and deciding whether investment in them is merited is an important step in understanding their benefits."

Jonathan Sprinkle, Diomidis Spinellis, Juha-Pekka Tolvanen, Marjan Mernik, ***Guest Editors' Introduction: What Kinds of Nails Need a Domain-Specific Hammer?****, IEEE Software, July 2009.*[670]

[670] DOI: 10.1109/MS.2009.92

"Maintenance in software-intensive systems is critical because software often continuously evolves not only during development but also after delivery, to meet users' ever-changing needs. So, maintenance performance significantly impacts software development productivity."

Lan Cao, Matti Rossi, Balasubramaniam Ramesh, ***Are Domain-Specific Models Easier to Maintain Than UML Models?****, IEEE Software, July 2009.*[671]

[671] DOI: 10.1109/MS.2009.87

"The single largest factor that led to a **language not being** used was when organizations gave the language design task to someone with **insufficient experience** in the **problem domain**."

Steven Kelly, Risto Pohjonen, ***Worst Practices for Domain-Specific Modeling****, IEEE Software, July 2009.*[672]

[672] DOI: 10.1109/MS.2009.109

"**Reusing DSLs** is **hard**, however, because they're often designed to precisely describe a single domain or concern. A new approach uses techniques from **software product lines** (SPLs) to improve the reusability of a DSL, DSL composition, or supporting tool by providing traceability of language concepts to DSL design."

Sumant Tambe, Jules White, Jeff Gray, James H. Hill, Aniruddha S. Gokhale, Douglas C. Schmidt, ***Improving Domain-Specific Language Reuse with Software Product Line Techniques****, IEEE Software, July 2009.*[673]

[673] DOI: 10.1109/MS.2009.95

"Although **lessons-learned activities** aid software process improvement, **few** IT industry **organizations** regularly and adequately **conduct them**."

Anders Baaz, Anna Sandberg, Agneta Nilsson, Lena Holmberg, Helena Olsson, ***Appreciating Lessons Learned****, IEEE Software, July 2009.*[674]

[674] DOI: 10.1109/MS.2009.198

"For the past 40 years… we've **tortured ourselves** over our **inability** to finish a software project **on time** and **on budget**. But … this **never** should have been the **supreme goal**. The **more important** goal is transformation, creating **software that changes the world** or that transforms a company or how it does business. We've been rather **successful at transformation**, often while operating outside our control envelope. Software development is and always will be somewhat **experimental**. The actual software construction isn't necessarily experimental, but its **conception is**. And this is where our focus ought to be. It's where our focus always ought to have been."

Tom DeMarco, ***Software Engineering: An Idea Whose Time Has Come and Gone?****, IEEE Software, July 2009.*[675]

[675] DOI: 10.1109/MS.2009.101

Human Aspects of Software Engineering

NOVEMBER | DECEMBER 2009

IEEE
Celebrating 125 Years of Engineering the Future

IEEE computer society

www.computer.org/software

“Software developers are notorious for **skimping** on **design documentation**, often eschewing it altogether. This trend has led to claims that it is merely an **impediment** in the **fast-paced** and highly pliable world of software development - a useless vestige of **old-style engineering** that should be eliminated altogether. … because of the **complexity** of modern software systems and the **cryptic nature** of current programming **languages**, **good design documentation** is not only useful but vital. However, we must seek ways of adapting it to suit the **medium** as well as the **exceptionally dynamic development** process.”

---

*Bran Selic, **Agile Documentation, Anyone?**, IEEE Software, November 2009.*[682]

[682] DOI: 10.1109/MS.2009.167

"Software is developed by people, used by people, and supports interaction among people. As such, **human characteristics** and **cooperation** are central to modern practical software construction."

Janice Singer, Cleidson R. B. de Souza, Helen Sharp, Gina Venolia, Li-Te Cheng, ***Guest Editors' Introduction: Cooperative and Human Aspects of Software Engineering****, IEEE Software, November 2009.*[683]

[683] DOI: 10.1109/MS.2009.176

“In the transformation from **traditional command-and-control** management to **collaborative self-managing** teams, the main challenges were the absence of **redundancy and conflict** between team- and individual-level autonomy.”

Tore Dybâ, Torgeir Dingsøyr, Nils Brede Moe, ***Overcoming Barriers to Self-Management in Software Teams****, IEEE Software, November 2009.*[684]

[684] DOI: 10.1109/MS.2009.182

“Data showed that **learning resources** for **APIs** are critically important and shed light on three issues: the need to **discover** the **design** and **rationale** of the API when needed, the challenge of finding **credible** usage API **examples** at the right level of complexity, and the challenge of understanding **inexplicable** API **behavior**.”

Martin P. Robillard, ***What Makes APIs Hard to Learn? Answers from Developers****, IEEE Software, November 2009.*[685]

[685] DOI: 10.1109/MS.2009.193

"**Small to medium enterprises** (SMEs) increasingly participate in **offshore software development**. Key competitive SME abilities include **detecting market niches** and deploying highly flexible software development approaches. Therefore, learning how offshoring affects such capabilities, which are closely related to organizational learning, is crucial."

Volker Wulf, Alexander Boden, Bernhard Nett, ***Operational and Strategic Learning in Global Software Development****, IEEE Software, November 2009.*[686]

[686] DOI: 10.1109/MS.2009.113

"Our aspirations grow faster than our capabilities, so **I don't expect software development to 'get solved.'**"

Mary Shaw, ***Continuing Prospects for an Engineering Discipline of Software****, IEEE Software, November 2009.*[687]

[687] DOI: https://doi.ieeecomputersociety.org/10.1109/MS.2009.172

"Advice on **courteousness** and **politeness** in **technical communication** is in short supply, yet this is needed when developers communicate with other people. When discussing technical problems, aim to encourage rather than complain, focusing on technology issues rather than the people behind them. Every **email** should tackle **one topic** and that topic should be **the subject line**."

Diomidis Spinellis, ***Basic Etiquette of Technical Communication****, IEEE Software, November 2009.*[688]

[688] DOI: 10.1109/MS.2009.170

“**Process metrics** can ignite **strong opinions** because they represent an area where **technical considerations** bump up against **human aspects** of software development. “

Forrest Shull, Medha Umarji, ***Measuring Developers: Aligning Perspectives and Other Best Practices****, IEEE Software, November 2009.*[689]

[689] DOI: 10.1109/MS.2009.180

"In his final **Loyal Opposition** column for IEEE Software, **Robert Glass** points out the continued need for **testing academic theories** in practice and for practitioners to **discuss lessons learned**. He also states that **software estimation** is a **deeply flawed** activity and that software practitioners should always remain open-minded."

Project Management

JANUARY | FEBRUARY 2010

IEEE computer society

www.computer.org/software

"The **software project management** body of knowledge is gradually being renewed across the entire lifecycle. In the **conception phase**, the focus is on **fostering innovation** through new approaches such as business analysis and crowdsourcing techniques. In the **construction phase**, the rise of **global software development** has shrunk the world and led to new approaches to risk management that take into account factors such as cultural diversity. In the **project conclusion** phase, new approaches to the evaluation of project success are being introduced, such as project **retrospectives** and **intellectual capital reporting**."

John Favaro, ***Guest Editor's Introduction: Renewing the Software Project Management Life Cycle****, IEEE Software, January 2010.*[691]

[691] DOI: 10.1109/MS.2010.9

"Developing parallel applications is notoriously difficult, but it's even more complex for desktop applications. The added difficulties primarily come from their interactive nature, where users largely perceive their performance. Desktop applications are typically developed with **graphical toolkits** that in turn have **limitations** in regards to **multithreading**."

Oliver Sinnen, Nasser Giacaman, ***Object-Oriented Parallelisation of Java Desktop Programs****, IEEE Software, January 2010.*[692]

[692] DOI: 10.1109/MS.2010.135

"If you're **successful**, stakeholders will **trust you**. However, **too much trust** can be **dangerous**. Stakeholders can become **overdependent** on your guidance, especially if they **lack the knowledge** to specify requirements for the new system. "

Neil Maiden, ***Trust Me, I'm an Analyst****, IEEE Software, January 2010.*[693]

[693] DOI: 10.1109/MS.2010.22

"Desktop software developers' interest in **graphics hardware** is increasing as a result of modern graphics cards' capabilities to act as compute devices that augment the **main processor**. This capability means parallel computing is no longer a dedicated task for the CPU. A trend toward heterogeneous computing combines the **main processor** and **graphics processing unit** (GPU)."

Frank Feinbube, Peter Troger, Andreas Polze, ***Joint Forces: From Multithreaded Programming to GPU Computing****, IEEE Software, January 2010.*[694]

[694] DOI: 10.1109/MS.2010.134

“The drive to rapidly develop layered, interconnected, and flexible systems has eclipsed consideration of resource costs. Consequently, **large Java applications** suffer from **runtime bloat**: a large and pervasive **infrastructure tax**, where simple transactions require a few hundred thousand method calls, and a server with 1 Gbyte of memory sometimes can only support a few hundred users.”

Edith Schonberg, Nick Mitchell, Gary Sevitsky, ***Four Trends Leading to Java Runtime Bloat****, IEEE Software, January 2010.*[695]

[695] DOI: 10.1109/MS.2010.7

"**Mobile devices** are increasingly accepted as suitable media for multimedia-rich applications. … the most popular development platform options … **Java ME**, **.NET Compact Framework**, **Flash Lite**, and **Android**."

Damianos Gavalas, Daphne Economou, ***Development Platforms for Mobile Applications: Status and Trends****, IEEE Software, January 2010.*[696]

[696] DOI: 10.1109/MS.2010.155

"Modern distributed software systems involve **dynamic operating conditions** that pose engineering challenges to traditional offline design. **Multiagent systems** engineering can solve some of these problems by offering self-adaptive features such as **loose coupling**, **context sensitivity**, and **robustness to failure**."

Michael Georgeff, Danny Weyns, ***Self-Adaptation Using Multiagent Systems****, IEEE Software, January 2010.*[697]

[697] DOI: 10.1109/MS.2010.18

"**Architecture** is just a collective hunch, **a shared hallucination**, an assertion by a set of stakeholders on the nature of their observable world, be it a world that is or a world as they wish it to be."

---

Agility and Architecture

MARCH | APRIL 2010

IEEE
IEEE computer society

www.computer.org/software

“Railroad tracks offer guidance and support. There are various tools that can give our software the same handling. The main tool for guiding the code’s direction is the **language’s type system**. For values, the type system can help us by establishing a separate type for each distinct class; for code, interfaces and abstract classes ensure that we won’t forget some crucial methods when we add functionality through a new class. With **domain-specific languages** or even suitably initialized data structures we can efficiently express exactly what the designer intended and nothing more. At a higher level, **architectures** that enforce a particular open-ended but well-defined interface will also guide a software’s progress. Finally, the most flexible track-laying approach is a **tool-supported** software development process.”

Diomidis Spinellis, ***Software Tracks***, *IEEE Software*, *March 2010.*[699]

[699] DOI: 10.1109/MS.2010.56

"In a typical **client-server scenario**, a server provides valuable services to client applications that run remotely on **untrusted client computers**. Typical examples are **video on demand**, online games, **voice-over-IP** communications, and many others. However, **client-side users** often hold **administrative privileges** on their machines and could tamper with the client application to fulfill the service in violation of the service usage conditions or service agreements. **Guaranteeing client-code security** is one of the most difficult security problem to address."

Paolo Tonella, Mariano Ceccato, ***CodeBender: Remote Software Protection Using Orthogonal Replacement****, IEEE Software, March 2010.*[700]

[700] DOI: 10.1109/MS.2010.158

"**Providing architecture** as a **service to application developers**. The approach is an effective way to implement the architecture process especially, but not only, in the context of agile development. In their role as stakeholders of nonfunctional system qualities, architects prepare and support developers by **participating** in **coding activities** and play a key role in **communicating** the architecture throughout the project's lifetime."

Roland Faber, ***Architects as Service Providers****, IEEE Software, March 2010.*[701]

[701] DOI: 10.1109/MS.2010.25

"**Agile development** delivers value quickly, using a series of short-term goals based on **immediate priorities**. **Architecture** grows value carefully, using a set of long-term objectives based on fundamental principles. The two seem at odds, but the architect can bring them together at four well-defined points in agile projects: during **project initiation** by setting architectural direction, through **storyboarding** by introducing specific architectural tasks, within sprints by close **collaboration on challenging issues**, and as working software gets delivered by performing **direct inspection**."

James Madison, ***Agile Architecture Interactions****, IEEE Software, March 2010.*[702]

[702] DOI: 10.1109/MS.2010.27

"**Unintentionally violating** open source software **(OSS) licenses** by reusing OSS code is a serious problem for both software companies and OSS developers. The simplest intuitive way to identify such reuse is to **measure code clones** - duplicated code fragments - between a suspected program and an existing OSS program."

Yuki Manabe, Satoshi Okahara, Kenichi Matsumoto, Akito Monden, ***Guilty or Not Guilty: Using Clone Metrics to Determine Open Source Licensing Violations****, IEEE Software, March 2010.*[703]

[703] DOI: 10.1109/MS.2010.159

"The evolution of **software into services** imposes certain concerns in the form of expressing and accessing services. The seamless proliferation of services demands a **new kind** of **software protection** with respect to **copyrights** and **moral rights** of service-based software to enable services' widespread use."

G.R. Gangadharan, Vincenzo D'Andrea, ***Managing Copyrights and Moral Rights of Service-Based Software****, IEEE Software, March 2010.*[704]

[704] DOI: 10.1109/MS.2010.161

"**Design tactics** are a methodology architects can use to master this challenge: choosing design solutions that are **simple**, **economic**, and **appropriate** for resolving the problems at hand."

Frank Buschmann, ***Learning from Failure, Part III: On Hammers and Nails, and Falling in Love with Technology and Design****, IEEE Software, March 2010.*[705]

[705] DOI: 10.1109/MS.2010.47

"How can an **organization transition** from several **functionally overlapping systems** to just one? This scenario is common after, for example, **company acquisitions** and mergers or as a result of different units in an organization growing to the point at which the two independent efforts must be synchronized to continue."

Ivica Crnkovi, Rikard Land, ***Oh Dear, We Bought Our Competitor: Integrating Similar Software Systems****, IEEE Software, March 2010.*[706]

[706] DOI: 10.1109/MS.2010.86

"**Enterprise architecture** and **technical architecture** are related yet **different**: whereas EA focuses on the architecture of a **business** that uses **software-intensive systems**, TA focuses on the architecture of the **software-intensive systems** that are used by a business to makes its mission manifest."

Grady Booch, ***Enterprise Architecture and Technical Architecture***, *IEEE Software, March 2010.*[707]

18 | Service Design: It's All in the Brand
96 | An Architectural Oxymoron
IEEE
IEEE computer society
www.computer.org/software

"The top questions were Agile and **large projects**. What factors can **break self-organization**? Do teams really need to always be **collocated** to collaborate effectively? **Architecture and agile**—how much design is enough for different classes of problem? Hard facts on **costs of distribution** (in $, £, €, and so on). The correlation between **release length** and **success rate**. **What metrics** can we use with minimal **side-effects**? Distributed agile and **trust**—what happens around 8–12 weeks? Statistics and data about how much **money/time is saved** by agile. **Sociological studies**—what were the personalities in successful/failed agile teams?"

Helen Sharp, Sallyann Freudenberg, ***The Top 10 Burning Research Questions from Practitioners****, IEEE Software, September 2010.*[724]

[724] DOI: 10.1109/MS.2010.129

“A collection of **coherent**, often **ideologically** or **theoretically** based **abstractions** constitutes a **programming paradigm**. … Well-known examples include **object-oriented**, **relational**, **functional**, **constraint-based**, **theorem-proving**, **concurrent**, **imperative**, and **declarative**. Less well-known (or perhaps less well-defined) examples include **graphical**, **reflective**, **context-aware**, **rule-based**, and **agent-oriented**. … using just **one language** technology and paradigm is becoming much **less common**, replaced by **multiparadigm programming** in which the heterogeneous application consists of several subcomponents, each implemented with an appropriate paradigm and able to communicate with other subcomponents implemented with a different paradigm. “

Dean Wampler, Tony Clark, ***Guest Editors' Introduction: Multiparadigm Programming****, IEEE Software, September 2010.*[725]

[725] DOI: 10.1109/MS.2010.119

"**Combining paradigms** offers important benefits—for example, OOP minimizes the conceptual gap between the problem domain and the implementation in software, and functional programming (FP) brings mathematical rigor and robustness to computing, especially for concurrent applications."

Dean Wampler, Tony Clark, ***Guest Editors' Introduction: Multiparadigm Programming****, IEEE Software, September 2010.*[726]

[726] DOI: https://doi.ieeecomputersociety.org/10.1109/MS.2010.119

"**Domain-specific languages** (DSLs) are becoming a mature application development tool that developers use to express concerns. **Multi-DSL** applications comprise DSLs and host language code. Exploiting the **Ruby** programming language's **built-in support** for the **imperative**, **functional**, and **object-oriented** paradigm, extended with **feature-oriented** programming …"

Sebastian Günther, ***Multi-DSL Applications with Ruby****, IEEE Software, September 2010.*[727]

[727] DOI: 10.1109/MS.2010.91

"**Constraint programming** (CP) is a young but rapidly developing technology that supports the modeling and solution of a wide range of **planning**, **scheduling**, **search**, and **optimization** problems. The integration of CP concepts into languages from other paradigms yields constraint-based multiparadigm programming."

Petra Hofstedt, ***Constraint-Based Object-Oriented Programming****, IEEE Software, September 2010.*[728]

[728] DOI: 10.1109/MS.2010.89

"**Storing data** the same **way it's used** in the application would simplify the programming model, making it easier to decentralize data processing and, in turn, enable horizontal scaling. Emerging **NoSQL** data-storage engines support this strategy. Just like the application layer, the data-storage layer can use multiple paradigms and store data in a way that's **semantically closer** to the corresponding domain models."

Debasish Ghosh, ***Multiparadigm Data Storage for Enterprise Applications****, IEEE Software, September 2010.*[729]

[729] DOI: 10.1109/MS.2010.87

“To some, the phrase ‘**agile architecture**’ is an **oxymoron**. “

Parallelism on the Desktop

IEEE computer society

"**Watts Humphrey** had a truly remarkable career, during which he developed or contributed to the **Personal Software Process**, **Team Software Process**, and **Capability Maturity Model Integration** (CMMI) framework, among many other contributions."

Forrest Shull, ***Watts Humphrey: 4 July 1927 - 28 October 2010****, IEEE Software, January 2011.*[736]

[736] DOI: 10.1109/MS.2011.21

"**Developers**, for the most part, **don't draw diagrams** because diagrams all too often don't offer any fundamental value that advances essential work. Yet, the problem remains that **we must visualize** ultra-large complex systems that have no directly observable physical manifestation."

---

*Grady Booch, **Draw Me a Picture**, IEEE Software, January 2011.*[737]

[737] DOI: 10.1109/MS.2011.4

"The computer industry is experiencing a major shift: **improved single processor performance** via **higher clock rates** has reached its technical limits due to overheating. … exploiting the **full potential** of these processors requires **parallel programming**."

Kurt Keutzer, Wolfram Schulte, Victor Pankratius, ***Guest Editors' Introduction: Parallelism on the Desktop****, IEEE Software, January 2011.*[738]

[738] DOI: 10.1109/MS.2011.8

“Writing a correct parallel program is difficult; writing a **highly modular parallel program** that performs well in a multiprogrammed environment is even more so. **Intel Threading Building Blocks** (Intel TBB), a key component of Intel Parallel Building Blocks , is a widely used C++ template library that helps developers achieve this goal.”

Michael Voss, Wooyoung Kim, ***Multicore Desktop Programming with Intel Threading Building Blocks****, IEEE Software, January 2011.*[739]

[739] DOI: 10.1109/MS.2011.12

"Looking at **software** from a **design perspective**, understanding software as a designed artifact, and considering how design reaches into the whole software life cycle can bring significant benefits both to our understanding of what works in software design and to our approach to tools and practices."

Andre van der Hoek, Alex Baker, Harold Ossher, Marian Petre, ***Guest Editors' Introduction: Studying Professional Software Design****, IEEE Software, January 2011.*[740]

[740] DOI: 10.1109/MS.2011.155

“**Software designers** make decisions covering a wide variety of aspects of the software to be designed through nested, intertwined processes. Some of these dependencies among design decisions might not be obvious, especially for people who didn’t start with the project at the beginning of the design process. Extending or **altering an existing design decision** without fully understanding its dependencies might result in a deterioration of the quality of the software design. “

Nobuto Matsubara, Kumiyo Nakakoji, Yoshinari Shirai, Yasuhiro Yamamoto, ***Toward Unweaving Streams of Thought for Reflection in Professional Software Design****, IEEE Software, January 2011.*[741]

[741] DOI: 10.1109/MS.2011.125

"**Collaboration** can enhance the output of **early-stage design**. When software designers or architects work together to define a problem and explore potential solutions, they find and address design problems earlier and arrive at more innovative and effective solutions than when they work alone. Nonetheless, collaboration can fail without **proper planning**."

Ania Dilmaghani, Jim Dibble, ***Strategies for Early-Stage Collaborative Design****, IEEE Software, January 2011.*[742]

[742] DOI: 10.1109/MS.2011.124

"A central task in design is deciding what artifact will best satisfy the client's needs, whether that requires creating an artifact or choosing from existing alternatives. **A design space** identifies and **organizes the decisions** that must be made, together with the alternatives for those decisions, thereby **providing guidance** for creating artifacts or a framework for comparing them."

---

*Mary Shaw, **The Role of Design Spaces**, IEEE Software, January 2011.*[743]

[743] DOI: 10.1109/MS.2011.121

"**Software design** is about **a sequence of steps** taken to achieve a goal. Designers must plan their approach to carrying out these steps. In studying designers at work, the authors observed **breadth- versus depth-first** approaches to design-space exploration and problem- versus solution-driven approaches during the actual design."

Hans van Vliet, Antony Tang, ***Design Strategy and Software Design Effectiveness****, IEEE Software, January 2011.*[744]

[744] DOI: 10.1109/MS.2011.130

"**Architectural decisions** are design decisions that are **hard to make** or **costly to change**."

Olaf Zimmermann, ***Architectural Decisions as Reusable Design Assets***, *IEEE Software, January 2011.*[745]

[745] DOI: 10.1109/MS.2011.3

"**Usability** has a significant impact on the success of software-centric systems and products. It relates to the actual usage of a system, but also to its effective design and development. Ultimately, failing to **build usable software** may degrade a project's ability to deliver in time, budget, functionality, and quality."

Frank Buschmann, ***Unusable Software Is Useless, Part 1****, IEEE Software, January 2011.*[746]

[746] DOI: 10.1109/MS.2011.19

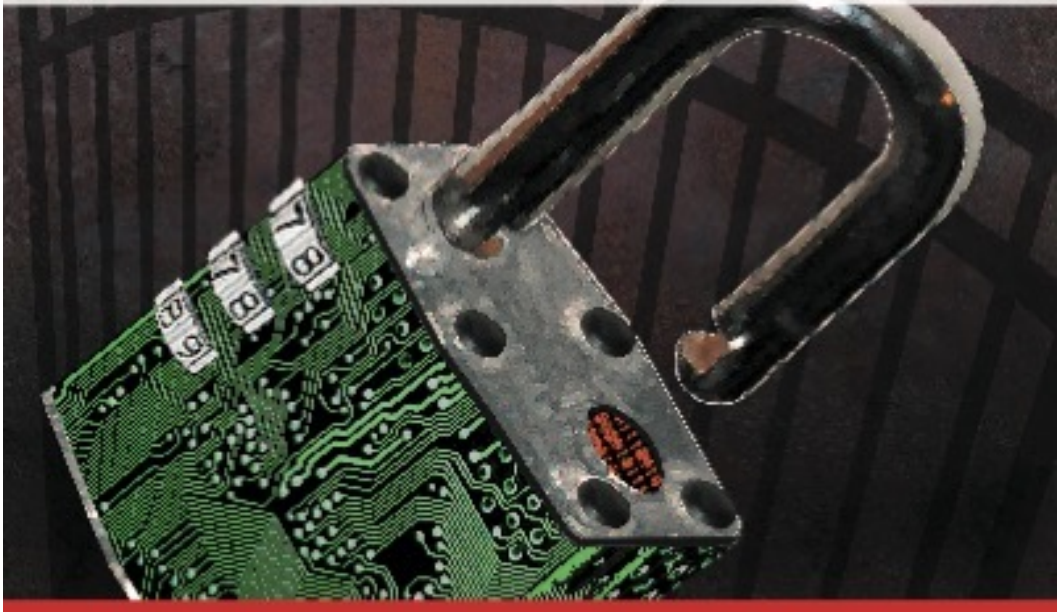
Software Protection



IEEE
IEEE computer society

"The metaphor of '**technical debt**' is useful for reasoning about trading off software development activities: An exclusive focus on implementing functionality can lead to **code decay**. Since this deterioration of the system usually reflects a **lack of** activity spent on **refactoring**, **documentation**, and other aspects of the **project infrastructure**, it can be viewed as a kind of debt that the developers owe the system."

Forrest Shull, ***Perfectionists in a World of Finite Resources****, IEEE Software, March 2011.*[747]

[747] DOI: 10.1109/MS.2011.38

"**Software protection** is increasingly becoming an important requirement for industrial software development, especially when building systems for **military defense**, **national infrastructure**, and **medical informatics**. Every software vendor should be **aware** of the **potential for attacks** against its products and the techniques available to mitigate these attacks. Employing **software protection techniques** can mean the difference between business survival and failure. "

Christian Collberg, Mikhail Atallah, Mariusz Jakubowski, Paolo Falcarin, ***Guest Editors' Introduction: Software Protection****, IEEE Software, March 2011.*[748]

[748] DOI: 10.1109/MS.2011.34

“Platforms such as **Windows Azure** let applications conduct data-intensive cloud computing. **Unit testing** can help ensure high-quality development of such applications, but the results **depend on** test inputs and the cloud **environment’s state**. Manually providing various test inputs and **cloud states** is laborious and time-consuming. However, automated test generation must **simulate** various **cloud states** to achieve effective testing.”

Jian Lu, Linghao Zhang, Tao Xie, Nikolai Tillmann, Xiaoxing Ma, Peli de Halleux, ***Environmental Modeling for Automated Cloud Application Testing****, IEEE Software, March 2011.*[749]

[749] DOI: 10.1109/MS.2011.158

"The large-scale, dynamic, and heterogeneous nature of cloud computing poses numerous security challenges. But the **cloud's** main challenge is to provide a **robust authorization mechanism** that incorporates **multitenancy** and **virtualization** aspects of resources."

Walid G. Aref, Arif Ghafoor, Saleh Basalamah, Abdulrahman A. Almutairi, Muhammad I. Sarfraz, ***A Distributed Access Control Architecture for Cloud Computing****, IEEE Software, March 2011.*[750]

[750] DOI: 10.1109/MS.2011.153

"As applications and services migrate to the cloud, testing will follow the same trend. Therefore, organizations must understand the **dynamics of cloud-based testing**. … cloud computing can make testing faster and enhance the delivery of testing services. Cloud computing also highlights important aspects of testing that require attention, such as **integration and interoperability**."

Ossi Taipale, Kari Smolander, Leah Riungu-Kalliosaari, ***Testing in the Cloud: Exploring the Practice****, IEEE Software, March 2011.*[751]

[751] DOI: 10.1109/MS.2011.132

"An experimental approach employs the **Google App Engine** (GAE) for high-performance parallel computing. A generic **master-slave framework** enables fast prototyping and integration of parallel algorithms that are transparently scheduled and executed on the Google cloud infrastructure. Compared to **Amazon Elastic Compute Cloud** (EC2), GAE offers lower resource-provisioning overhead and is cheaper for jobs shorter than one hour."

Radu Prodan, Simon Ostermann, Michael Sperk, ***Evaluating High-Performance Computing on Google App Engine****, IEEE Software, March 2011.*[752]

“If you give a **hurricane meteorologist** a giant pile of data about a storm spinning in the middle of the Atlantic Ocean and ask her to **determine exactly** where it will come ashore, she can analyze the data, construct a detailed and accurate model of the atmospheric conditions and weather patterns, run some simulations, and come up with a forecast—**two months after** the storm hits. It’ll probably be wrong, but not by much, a moot point for the people in the storm’s path. The **problem isn’t** with the **forecast’s accuracy** but with **the time** needed to prepare it. On the other extreme, if given a satellite image and a few points of other data—and a few minutes—a hurricane meteorologist can prepare a forecast so uncertain it might as well not even exist. There is a point where forecast **accuracy and timeliness overlap**. The model favored by hurricane meteorologists is to **do just enough** data acquisition and analysis to **be reasonably certain** what the storm will do and then **start telling people** to get ready.”

Eric Richardson, ***What an Agile Architect Can Learn from a Hurricane Meteorologist****, IEEE Software, November 2011.*[766]

[766] DOI: 10.1109/MS.2011.152

"Software systems must **continually evolve** to meet ever changing needs. However, such systems often become **legacy systems** as a consequence of **uncontrolled maintenance** combined with **obsolete technology**. To control maintenance costs and preserve complex embedded business rules, companies must **evolve their legacy systems**."

Mario Piattini, Ignacio García-Rodriguez de Guzmán, Christof Ebert, Ricardo Pérez-Castillo, ***Reengineering Technologies****, IEEE Software, November 2011.*[767]

[767] DOI: 10.1109/MS.2011.145

"There is complexity, and then there is organized complexity. **Pure complexity** is **chaotic**; **organized complexity** is full of **patterns**. Naming these **patterns** and respecting their intention is the essence of architecture."

---

*Grady Booch, **The Architecture of Small Things**, IEEE Software, November 2011.*[768]

[768] DOI: 10.1109/MS.2011.148

"**Climate change** is likely to be one of the defining global issues of the 21st century. The past decade - the hottest in recorded history - has witnessed countries around the world struggling to deal with drought, heat waves, and extreme weather. The sheer **scale of the problem** also makes it hard to understand, predict, and solve. **Climate science** journals regularly publish special issues on specific climate models, typically timed to present results from a major new release of a given model. However, these tend to focus on the **new science** that the model enables, rather than to describe the **software** and its development."

Steve M. Easterbrook, Venkatramani Balaji, Reinhard Budich, Paul N. Edwards, ***Guest Editors' Introduction: Climate Change - Science and Software****, IEEE Software, November 2011.*[769]

[769] DOI: 10.1109/MS.2011.141

"The **Clear Climate Code** project rewrote GISTEMP, a legacy software system used to produce an important global surface temperature dataset. The **focus** of the project is **on clarity**: making the source code as clear as possible to interested people, to **improve public understanding**."

David Jones, Nicholas Barnes, ***Clear Climate Code: Rewriting Legacy Science Software for Clarity****, IEEE Software, November 2011.*[770]

[770] DOI: 10.1109/MS.2011.113

"**Coupled climate models** exhibit scientific, numerical, and architectural **variability.** This variability introduces requirements that give rise to **complexity**."

Spencer Rugaber, Sameer Ansari, Leo Mark, Rocky Dunlap, ***Managing Software Complexity and Variability in Coupled Climate Models****, IEEE Software, November 2011.*[771]

[771] DOI: 10.1109/MS.2011.114

"**Models** play a central role for **climate change policy-makers**, but they're often so **complex and computationally demanding** that experts must run them and interpret their results. This reduces stakeholders' ability to **explore alternative scenarios**, increases perceptions of model complexity and opacity, and can ultimately reduce public confidence ."

"A close look at the **evidence** underpinning the original concept of **lean production** and its popular interpretation reveals the inherent challenges of measuring and interpreting evidence for performance differences."

Helen Sharp, Tore Dybå, ***What's the Evidence for Lean?****, IEEE Software, September 2012.*[797]

[797] DOI: 10.1109/MS.2012.126

"Although some claim that **principles from other fields** can't apply to a creative and design-oriented discipline such as software development, many studies have proven **the simple wisdom** that we all benefit from **empowered and motivated teams**, we build our products faster and with better quality if **market strategy is understood** and **requirements changes managed**, we **learn from previous defects**, we can emphasize **repeatable processes**, and we should build from high-quality components. The software industry is now poised to transform to **customer-centric development**, which translates into both reducing the total life-cycle cost and increasing efficiency and effectiveness by **eliminating waste** and **adding value**."

Pekka Abrahamsson, Christof Ebert, Nilay Oza, ***Lean Software Development****, IEEE Software, September 2012.*[798]

[798] DOI: 10.1109/MS.2012.116

"The term '**lean**' … describes any efficient management practice that **minimized waste**, including in product development … In lean terms, '**waste**' is anything that doesn't either **add customer value directly** or **add knowledge** about how to deliver that value more effectively."

Mary Poppendieck, Michael A. Cusumano, ***Lean Software Development: A Tutorial****, IEEE Software, September 2012.*[799]

[799] DOI: 10.1109/MS.2012.107

"**Lean practices** use the principle of **Little's law** to improve the flow of value to the end user by eliminating sources of waste from a software development process. **Little's law** defines throughput as a ratio of **work in process** and **cycle time**. Increasing throughput (or productivity) requires continuously improving (that is, decreasing) cycle time while ensuring that the work-in-process limit doesn't exceed the capacity available to process the work."

Robert L. Nord, Ipek Ozkaya, Raghvinder S. Sangwan, ***Making Architecture Visible to Improve Flow Management in Lean Software Development****, IEEE Software, September 2012.*[800]

[800] DOI: 10.1109/MS.2012.109

“Modern **virtualization technology** allows us to run operating systems in a virtual machine that can be hosted on facilities ranging from our laptop to a datacenter in the cloud. It’s thus possible to create **a virtualized development environment** that contains all the tools, applications, and libraries that a programmer requires. This speeds up developer setup time, brings economies of scale, introduces parity between development and production environments, allows the use of platform-specific tools, and simplifies embedded-system development. Using VMs, testers can ensure a **pristine environment** and access to diverse (virtual) platforms. Deployment is also simplified by packaging all the system’s components and setup into a **VM appliance**. Finally, on the operations side, VMs make it easier for a system to support application **provisioning**, **maintenance windows**, **high availability**, and **disaster recovery**.”

"Computing is transforming every aspect of the human experience. As creators of this technology, what obligations do we have to the **general public**, for whom we make the **complex machinery** of computing increasingly invisible? … it's important for the general public to know something about the **technology behind the curtain** of computing."

---

*Grady Booch, **The Great and Terrible Oz**, IEEE Software, January 2013.*[806]

[806] DOI: 10.1109/MS.2013.16

"Most people think of **requirements** as things to manipulate at the **start of a project**. Others, more enlightened, recognize that requirements also have a role toward the end of projects to **test compliance**. But few people have recognized an active role for requirements during their **system's use** - to **monitor** whether the system continues to **comply with its requirements** during its lifetime."

---

*Neil Maiden, **Monitoring Our Requirements**, IEEE Software, January 2013.*[807]

[807] DOI: 10.1109/MS.2013.10

"'**Innovation**' and '**innovative architecture**' are topics of broad popularity in software engineering. Yet, the two terms appear to mean different things to different people – with interpretations of both driven more by **personal interests** than by their **true meanings**. It's therefore essential for architects to have a clear understanding of what 'innovation' means in the context of their projects if they are to make the **right design decisions** and communicate the **intended messages** to project stakeholders."

---

*Frank Buschmann, **Innovation Reconsidered**, IEEE Software, January 2013.*[808]

[808] DOI: 10.1109/MS.2013.9

"Over the past decade, the advent of **social networking** has fundamentally altered the landscape of how software is used, designed, and developed. It has expanded how **communities of software stakeholders** communicate, **collaborate**, **learn** from, and **coordinate** with one another."

Andrew Begel, Jan Bosch, Margaret-Anne Storey, ***Bridging Software Communities through Social Networking****, IEEE Software, January 2013.*[809]

[809] DOI: 10.1109/MS.2013.3

"**Software development** is increasingly carried out by **developer communities** in a **global setting**. One way to prepare for development success is to uncover and **harmonize** these **communities** to exploit their collective, collaborative potential."

Hans van Vliet, Patricia Lago, Damian A. Tamburri, ***Uncovering Latent Social Communities in Software Development****, IEEE Software, January 2013.*[810]

[810] DOI: 10.1109/MS.2012.170

"A new generation of **development environments** takes a radical approach to communication and coordination by **fusing social networking** functionality with flexible, **distributed version control**. Through these transparent work environments, people, repositories, development activities, and their histories are immediately and easily visible to all users …. **transparency** helps developers on **GitHub** manage their projects, handle dependencies more effectively, reduce communication needs, and figure out what requires their attention."

James Herbsleb, Jason Tsay, Colleen Stuart, Laura Dabbish, ***Leveraging Transparency****, IEEE Software, January 2013.*[811]

[811] DOI: 10.1109/MS.2012.172

"The **Social Web** provides comprehensive and publicly available **information about software developers**, identifying them as **contributors** to open source projects, **experts** at maintaining ties on social network sites, or **active participants** on knowledge-sharing sites. These **signals**, when aggregated and summarized, could be used to define potential **candidates' individual profiles**: potential employers could qualitatively evaluate job seekers, even those lacking a formal degree or changing their career path, by assessing candidates' online contributions."

Andrea Capiluppi, Alexander Serebrenik, Leif Singer, ***Assessing Technical Candidates on the Social Web****, IEEE Software, January 2013.*[812]

[812] DOI: 10.1109/MS.2012.169

"Many successful software companies use **social networking** as a way to **improve the services** or products they provide. … semistructured interviews with leaders from four successful companies: **Brian Doll**, an engineer who manages GitHub's marketing; **Doug Laundry**, a principal group program manager at Microsoft; **David Fullerton**, vice president of engineering at Stack Exchange; and **Robert Hughes**, the president and chief operating officer of TopCoder."

Andrew Begel, Jan Bosch, Margaret-Anne Storey, ***Social Networking Meets Software Development: Perspectives from GitHub, MSDN, Stack Exchange, and TopCoder****, IEEE Software, January 2013.*[813]

[813] DOI: 10.1109/MS.2013.13

"**Mutation testing** improves a system's bug-detection capability. It also helps improve coverage by exposing software or code areas that other types of testing might not expose."

Izzat Mahmoud Alsmadi, ***Using Mutation to Enhance GUI Testing Coverage***, *IEEE Software, January 2013.*[814]

[814] DOI: 10.1109/MS.2012.22

"**What works** for **whom**, **where**, **when**, and **why** is the ultimate question of **evidence-based software engineering**. Still, the empirical research seems mostly concerned with identifying **universal relationships** that are independent of how work settings and other contexts interact with the processes important to software practice. Questions of '**What is best?**' seem to prevail. For example, 'Which is better: pair or solo programming? test-first or test-last?' However, just as the question of **whether a helicopter is better than a bicycle** is meaningless, so are these questions because the answers depend on the settings and goals of the projects studied."

Tore Dyba, ***Contextualizing empirical evidence****, IEEE Software, January 2013.*[815]

[815] DOI: 10.1109/MS.2013.4

"**Testing** is a **destructive task** in which the goal is to find relevant defects as early as possible. It **requires automation** to reduce cost and ensure high regression, thus delivering determined quality. … In practice, **XUnit** frameworks are the most used technology to automate tests. In such frameworks, test cases are written in an **executable language** and can be executed automatically. They also provide specific operations to implement the **test case oracles**."

Macario Polo, Pedro Reales, Mario Piattini, Christof Ebert, ***Test Automation****, IEEE Software, January 2013.*[816]

"The subject of the **computability of the mind** introduces complex philosophical, ethical, and technical issues. That aside, this topic draws us in to the **nature of algorithms**. We are **surrounded by algorithms**; much of the history of computing is also the history of the advance of algorithms. For the public, algorithms are part of **computing's self-made mystery**, but to understand their nature is an important part of computational thinking."

---

*Grady Booch, **From Minecraft to Minds**, IEEE Software, March 2013.*[817]

[817] DOI: 10.1109/MS.2013.28

"**Requirements work** is really about **problem solving**. Its primary function is to locate and scope problems, then create and describe solutions for them."

Neil Maiden, ***So, What Is Requirements Work?****, IEEE Software, March 2013.*[818]

[818] DOI: 10.1109/MS.2013.35

"**Quality concerns**, often referred to as **nonfunctional requirements**, **service-level agreements**, **quality attributes**, **performance constraints**, or **architecturally significant requirements**, describe system-level attributes such as **security**, **performance**, **reliability**, and **maintainability**. In conjunction with functional requirements, these quality concerns drive and constrain a **system's architectural design** and often introduce significant **trade-offs** that must be carefully considered and balanced. The dependencies that exist between requirements and architecture have been referred to as the **twin peaks** of requirements and architecture."

Jane Cleland-Huang, Robert S. Hanmer, Sam Supakkul, Mehdi Mirakhorli, ***The Twin Peaks of Requirements and Architecture****, IEEE Software, March 2013.*[819]

[819] DOI: 10.1109/MS.2013.39

"The most useful forms of **documentation** are **views of the software** that can be **automatically generated**."

Mehdi Mirakhorli, Jane Cleland-Huang, ***Traversing the Twin Peaks****, IEEE Software, March 2013.*[820]

[820] DOI: 10.1109/MS.2013.40

"In the past decade, researchers have devised many methods to support and **codify architecture design**. However, what hampers such methods' adoption is that these methods employ abstract concepts such as **views**, **tactics**, and **patterns**, whereas practicing software architects choose technical design primitives from the services offered in **commercial frameworks**. … systematically links both **top-down concepts**, such as **patterns** and **tactics**, and **implementation artifacts**, such as frameworks, which are bottom-up concepts."

Rick Kazman, Perla Velasco-Elizondo, Humberto Cervantes, ***A Principled Way to Use Frameworks in Architecture Design****, IEEE Software, March 2013.*[821]

[821] DOI: 10.1109/MS.2012.175

“Systems are naturally constructed in **hierarchies**, in which **design choices** made at higher levels of abstraction levy requirements on system components at the lower levels. Thus, whether an aspect of a system is a **design choice** or **a requirement** largely depends on your **vantage poin**t within the system components’ hierarchy. “

Sanjai Rayadurgam, Mats P.E. Heimdahl, Anitha Murugesan, Darren Cofer, Andrew Gacek, Michael W. Whalen, ***Your ”What” Is My ”How”: Iteration and Hierarchy in System Design****, IEEE Software, March 2013.*[822]

[822] DOI: 10.1109/MS.2012.173

"Software architects often must work with **incomplete or ill-specified non-functional requirements** (NFRs) and use them to make decisions. Through this process, existing NFRs are **refined or modified** and new ones emerge. … The survey revealed that architects usually elicit NFRs themselves in an iterative process; they usually **don't document** the NFRs and only **partially validate** them."

Claudia Ayala, David Ameller, Jordi Cabot, Xavier Franch, ***Non-functional Requirements in Architectural Decision Making****, IEEE Software, March 2013.*[823]

[823] DOI: 10.1109/MS.2012.176

"There's clearly **no single magic tool** or technique that can be used to secure the reliability of any large and complex software application; rather, it takes good tools, workmanship, and a carefully managed process. The three main control points in this process are **prevention**, **detection**, and **containment**."

Gerard J. Holzmann, ***Landing a Spacecraft on Mars****, IEEE Software, March 2013.*[824]

[824] DOI: 10.1109/MS.2013.32

"Software development teams no longer live - or want to live - in a world of **command and control**. They want to be **self-organizing** and have adaptive, supportive, and **collaborative leadership** guiding them. This new age of management requires managers to build a **culture of trust**, encourage **participation** of their teams in decision making, and **sponsor innovation**. Simply put, managers need to do away with the traditional (micro) management and **share power** with self-organizing teams."

"**The fast-changing nature** of our field is one of the things that make working in software so much **fun** — and so **challenging**."

---

*Forrest Shull, **The Only Constant Is Change**, IEEE Software, July 2013.*[836]

[836] DOI: https://doi.ieeecomputersociety.org/10.1109/MS.2013.115

"For those on the outside of the **curtain of computing**, there is **much mystery** behind the matter of software-intensive systems. To some, it looks like magic; to most, its inner workings are irrelevant insofar that it simply works. To those of us behind the curtain, however, we know that such systems are filled with **chaos, regularity, and beauty**."

---

*Grady Booch, **The Wonder Years**, IEEE Software, July 2013.*[837]

[837] DOI: 10.1109/MS.2013.89

"Deciding whether to **write portable code** or not should be the outcome of a **cost-benefit analysis**. The key reason to favor portable code is that it opens up the **selection of resources** available to our project. Diverse technology choices free us from vendor lock-in, allowing us to select the best technology in each area based on quality and price, and minimize technology risks. However, portable code can **degrade functionality**, expressiveness, and efficiency."

Diomidis Spinellis, ***Portability: Goodies vs. the Hair Shirt****, IEEE Software, July 2013.*[838]

[838] DOI: 10.1109/MS.2013.82

"Many practitioners and researchers have turned to **analytics**—that is, the use of analysis, data, and systematic reasoning for making decisions. We can define software analytics as follows: '**Software analytics** is **analytics on software data** for managers and software engineers with the aim of empowering software development individuals and teams to **gain and share insight** from their data to make better decisions.'"

Tim Menzies, Thomas Zimmermann, ***Software Analytics: So What?****, IEEE Software, July 2013.*[839]

[839] DOI: 10.1109/MS.2013.86

"**Performance** is a critical component of **customer satisfaction** with network-based applications. Unfortunately, accurately evaluating the **performance of collaborative software** that operates in extremely heterogeneous environments is difficult with traditional techniques such as modeling workloads or testing in controlled environments."

Sandipan Ganguly, Brian Bussone, Christian Bird, Danyel Fisher, Jacqueline Richards, Robert Musson, ***Leveraging the Crowd: How 48,000 Users Helped Improve Lync Performance****, IEEE Software, July 2013.*[840]

[840] DOI: 10.1109/MS.2013.67

"Prominent technology companies including IBM, Microsoft, and Google have embraced an **analytics-driven culture** to help improve their **decision making**. Analytics aim to help practitioners answer questions critical to their projects, such as 'Are we on track to deliver the next release on schedule?' and 'Of the recent features added, which are the most prone to defects?' by providing **fact-based views** about projects. Analytic results are often quantitative in nature, presenting data as **graphical dashboards** with reports and charts."

Olga Baysal, Michael W. Godfrey, Reid Holmes, ***Developer Dashboards: The Need for Qualitative Analytics****, IEEE Software, July 2013.*[841]

[841] DOI: 10.1109/MS.2013.66

"**Defect density** is the ratio between the **number of defects** and **software size**. Properly assessing defect density in evolutionary product development requires a strong tool and rigid process support that enables defects to be traced to the offending source code. In addition, it requires waiting for **field defects** after the product is deployed."

David Faller, Yang-Ming Zhu, ***Defect-Density Assessment in Evolutionary Product Development: A Case Study in Medical Imaging****, IEEE Software, July 2013.*[842]

[842] DOI: 10.1109/MS.2012.111

"Today's software development challenges require **learning teams** that can continuously apply new engineering and management practices, new and complex **technical skills**, **cross-functional skills**, and **experiential lessons** learned. The pressure of delivering working software often forces software teams to **sacrifice learning**-focused practices. Effective **learning under pressure** involves conscious efforts to implement original agile practices such as retrospectives and adapted strategies such as learning spikes. Teams, their management, and customers must all recognize the importance of creating **learning teams** as the key to braving the erratic climates and uncharted territories of future software development."

“One of the most notable categories of successful UI development is **form-oriented frameworks** tightly coupled with **relational database** management systems. Essentially, this approach builds a UI for relational database applications by organizing that **interface into forms**, which present values of database fields in the corresponding form controls, such as text boxes, list boxes, check boxes, grids, and so on. Tools and runtime engines support generic navigation through these forms and direct coupling of controls with the back-end data. The developer doesn’t need to take care of data locking, transfer, transformation, and updates: when the user switches to another record in the master part of a master-details form, for example, the mechanism incorporated in the generic form **automatically refreshes** the values in the details part.”

“Over the past decades, today, and in the future, business contexts in software organizations and the common ways of developing software are changing dramatically. Formation of **teams in distributed environments**, virtual or not, calls for new ways of working across **geographic**, **temporal**, and **cultural boundaries**. This, however, also requires **effective leadership** approaches enabled through systems, processes, technology, and people.”

Darja Smite, Marco Kuhrmann, Patrick Keil, ***Virtual Teams [Guest editors’ introduction]****, IEEE Software, November 2014.*[898]

[898] DOI: 10.1109/MS.2014.149

“Software engineering is a field in which distributed development through **virtual teams** is a **fact of life**. … a set of eight **core requirements** for support environments for virtual software teams … (1) Enable **Unobtrusive Awareness** Information Exchange … (2) Make Basic Work-Related **Data Available** … (3) Provide **Multisource Data** Combinations … (4) **Filter** Irrelevant Information … (5) Represent and Recognize **Current Contexts** of Team Members … (6) Support the **Overhearing** of Conversations … (7) Support **Mood Sharing** … (8) … “

Kevin Dullemond, Ben van Gameren, Rini van Solingen, ***Collaboration Spaces for Virtual Software Teams****, IEEE Software, November 2014.*[899]

[899] DOI: 10.1109/MS.2014.105

"In today's world, many companies turn to open source projects as a method to increase productivity and innovation. A major challenge with managing this kind of development is the **onboarding of new developers** into the virtual teams that drive such projects. There's little guidance on how to initiate new members into such teams and how to overcome the learning curve. This case study on open source software projects shows that **mentoring** can have a significant impact on onboarding new members into virtual software development teams."

Fabian Fagerholm, Alejandro Sanchez Guinea, Jay Borenstein, Jurgen Munch, ***Onboarding in Open Source Projects****, IEEE Software, November 2014.*[900]

[900] DOI: 10.1109/MS.2014.107

“Do I think that there are some universals? Absolutely I do. And looking for **a team or cultural fit**, looking for people who are **motivated** and have good **communication** and good **collaboration**, my suspicion is that those are universal qualities that make people successful.”

Tobias Kaatz, ***Hiring in the Software Industry***, *IEEE Software, November 2014.*[901]

[938] DOI: 10.1109/MS.2016.10

"The debacle with the **VW 'defeat device'** raises some unsettling questions. Are any other companies doing this, or-if we take a more cynical standpoint-how many are doing this? If they aren't, are they still using software practices almost as dubious? How do we decide **what's reasonable**, given software's extraordinary ability to give hardware its character?"

Les Hatton, Michiel van Genuchten, ***When Software Crosses a Line****, IEEE Software, January 2016.*[939]

[939] DOI: 10.1109/MS.2016.6

“This year marks the 50th anniversary of the Turing Award, which was first given to **Alan Perlis**, an oft-quoted mathematician who described **the relationship** between **humans and computers** as having ‘a vitality like a **gangly youth** growing out of his clothes within an **endless puberty**.’ Now that our dependence on software permeates nearly every aspect of our lives, it’s time to ask ourselves where this relationship is headed and, even though software engineering is still a relatively new discipline, **how much we’ve matured**.”

Forrest Shull, Anita Carleton, Jeromy Carriere, Rafael Prikladnicki, Dongmei Zhang, ***The Future of Software Engineering****, IEEE Software, January 2016.*[940]

[940] DOI: 10.1109/MS.2016.8

“Tim O’Reilly: Code for America is **changing government** and changing how we think about our role as software professionals. Its work is deeply rooted in the notion that you can **no longer govern without** using **digital technology**. Technology is central to how we deliver services today and how people access them. “

Andrew Moore, Tim O’Reilly, Paul D. Nielsen, Kevin Fall, ***Four Thought Leaders on Where the Industry Is Headed****, IEEE Software, January 2016.*[941]

[941] DOI: 10.1109/MS.2016.1

“To most people, “**massive systems**” probably means those systems run by NASA, airline companies, or large banks, or operating systems such as Microsoft Windows. What’s in common? They all have **complex components or subsystems**, deal with massive data, support millions of customers, require **real-time response**, and more. If they malfunction, catastrophe might ensue. By those standards, many systems run by **today’s Internet companies** also **qualify as massive**. As the Internet grows so quickly, many Internet companies are suffering the same problems that **massive systems** have suffered. “

Zhengrong Tang, Melissa Yang, Joshua Xiang, John Liu, ***The Future of Chinese Software Development****, IEEE Software, January 2016.*[942]

[942] DOI: 10.1109/MS.2016.19

"**Practitioners** must become **mediators** of the process of **creating a humane experience** and expand their practice to draw from disciplines such as **experience design**, systems thinking, **economics**, and digital strategy. They must do what they can to mitigate the **negative consequences** of technology while continuing to exploit and amplify its positive impacts."

Claudia de O. Melo, Ronaldo Ferraz, Rebecca J. Parsons, ***Brazil and the Emerging Future of Software Engineering****, IEEE Software, January 2016.*[943]

[943] DOI: 10.1109/MS.2016.28

"Software is being produced so fast that its growth hinders its sustainability. **Technical debt**, which encompasses **internal software quality**, evolution and maintenance, reengineering, and economics, is growing such that its management is becoming the dominant driver of software engineering progress. It spans the **software engineering life cycle**, and its management capitalizes on recent advances in fields such as source code analysis, quality measurement, and project management. **Managing technical debt** will become an investment activity applying **economic theories**."

Paris Avgeriou, Philippe Kruchten, Robert L. Nord, Ipek Ozkaya, Carolyn Seaman, ***Reducing Friction in Software Development****, IEEE Software, January 2016.*[944]

[944] DOI: 10.1109/MS.2016.13

"Almost surreptitiously, **crowdsourcing** has entered software engineering practice. **In-house development**, contracting, and outsourcing still dominate, but many development projects use crowdsourcing-for example, to squash bugs, test software, or gather alternative UI designs. Although the overall impact has been mundane so far, crowdsourcing could lead to **fundamental, disruptive changes** in how software is developed."

Thomas D. LaToza, Andre van der Hoek, ***Crowdsourcing in Software Engineering: Models, Motivations, and Challenges****, IEEE Software, January 2016.*[945]

[945] DOI: 10.1109/MS.2016.12

"An evaluation of recent industrial and societal trends revealed three key factors driving **software engineering's future**: **speed**, **data**, and **ecosystems**."

Jan Bosch, ***Speed, Data, and Ecosystems: The Future of Software Engineering****, IEEE Software, January 2016.*[946]

[946] DOI: 10.1109/MS.2016.14

"Today's **social-coding tools** foreshadow a transformation of the software industry, as it relies increasingly on **open libraries**, frameworks, and **code fragments**. Our vision calls for new **intelligently transparent services** that support **rapid development** of innovative products while helping developers manage risk and issuing them **early warnings** of looming failures. Intelligent transparency is enabled by an infrastructure that applies **analytics** to data from all phases of the life cycle of open source projects, from development to deployment. Such an infrastructure brings stakeholders the information they need when they need it."

James Herbsleb, Christian Kastner, Christopher Bogart, ***Intelligently Transparent Software Ecosystems****, IEEE Software, January 2016.*[947]

[947] DOI: 10.1109/MS.2015.156

"We're living in a **physical world** that's **moving at the speed of software**. This means that software's trajectory will drive software engineering, not vice versa. However, software engineering is also driven by visionary corporate leaders, backed by skilled software developers."

George Hurlburt, Jeffrey Voas, ***Software is Driving Software Engineering?****, IEEE Software, January 2016.*[948]

[948] DOI: 10.1109/MS.2016.22

“**Apache Mesos**, … abstracts away many of the hassles of managing a **distributed system**. … You don’t have to think about how you’re going to **get your task** to a **different machine** with Mesos. You just tell it, ‘**Run** this task using **these resources**; those resources are tied to a particular machine,’ and then **Mesos takes care** of getting the task there, **starting** the task, and **watching** it while it’s actually running on that machine. Mesos provides **primitives** that somebody building a distributed system can take advantage of. “

CELEBRATING 70 YEARS

"Being **a good software architect** has never been easy. Changes in the software industry are making the job even more challenging. The key drivers are the rising role of software in systems and their operation; more emphasis on **reuse**, **agility**, and **testability** during software development; and several quality elements increasingly affected by architectural choices."

Diomidis Spinellis, ***The Changing Role of the Software Architect****, IEEE Software, November 2016.*[991]

[991] DOI: 10.1109/MS.2016.133

“Documenting **the time dimension** part of your architecture might look like extra work. However, **anticipation** should be a large part of your job as an architect, anyway. If you **communicate your anticipation** as an evolution viewpoint or architecture roadmap, your architecture description will stay valid longer. And, you’ll have a ready answer when stakeholders ask how you’ve addressed their change and planning concerns.”

Eltjo Poort, ***Just Enough Anticipation: Architect Your Time Dimension****, IEEE Software, November 2016.*[992]

[992] DOI: 10.1109/MS.2016.134

“As new and exciting healthcare applications arise that use **smart technologies**, the **Internet of Things**, **data analytics**, and other technologies, a critical problem is emerging: the potential loss of caring. Although these exciting technologies have improved patient care by allowing for better assessment, surveillance, and treatment, their use can disassociate the caregiver from the patient, essentially removing the ”care” from healthcare. So, you can view caring as an undiscovered -ility that ranks at least as important as other well-known -ilities in healthcare systems.”

Nancy Laplante, Phillip A. Laplante, Jeffrey Voas, ***Caring: An Undiscovered ”Super -ility” of Smart Healthcare****, IEEE Software, November 2016.*[993]

[993] DOI: 10.1109/MS.2016.136

“When customers visit a **Brazilian e-commerce** site and search for a product, they’re likely using software developed by **Neemu**, a start-up created in **Manaus**, a city in the heart of the **Amazon rainforest**. Nowadays, millions of people throughout Brazil use this software, which demonstrates alternative economic **development in Amazonia** that has low impact on the environment.”

Edleno Silva de Moura, Mauro Rojas Herrera, Leonardo Santos, Tayana Conte, ***When Software Impacts the Economy and Environment****, IEEE Software, November 2016.*[994]

[994] DOI: 10.1109/MS.2016.135

“Forty years ago, **Thomas McCabe** introduced his famous **cyclomatic complexity** (CC) metric. Today, it’s still one of the **most popular and meaningful** measurements for analyzing code. “

---

*Christof Ebert, James Cain, **Cyclomatic Complexity**, IEEE Software, November 2016.*[995]

[995] DOI: 10.1109/MS.2016.147

"**Internet scale**, the increasing rate of technology evolution, and the broad adoption of lean and agile methods have triggered a profound change in not only application and infrastructure architectures but also the **software architect**'s roles and responsibilities."

Gregor Hohpe, Ipek Ozkaya, Uwe Zdun, Olaf Zimmermann, ***The Software Architect's Role in the Digital Age****, IEEE Software, November 2016.*[996]

[996] DOI: 10.1109/MS.2016.137

"The popularity of agile methods such as **Scrum** and **Kanban**, with their clear focus on **team collaboration**, threatens many roles traditionally assigned to individual experts. Some organizations are even challenging the raison d'être of the software architect role. However, researchers' experiences developing connected-vehicle software revealed **two reasons** why successful projects still often assign **architecture-related responsibilities** to individual experts acting as software architects. First, **the experts** help effectively **manage complexity**; second, they act as **knowledge multipliers** when development must scale up."

Soren Frey, Lambros Charissis, Jens Nahm, ***How Software Architects Drive Connected Vehicles****, IEEE Software, November 2016.*[997]

[997] DOI: 10.1109/MS.2016.145

"**Software architects** are key assets for successful development projects. … researchers investigated how architects at **Ericsson** were organized, their roles and responsibilities, and **the effort** they spent guarding and governing a large-scale legacy product developed by teams at multiple locations. … the architectural decisions were centralized to a **team of architects**. The team extensively **used code reviews** to not only check the code's state but also reveal defects that could turn into maintainability problems. … **the effort** architects spend designing architecture, guarding its integrity and evolvability, and mentoring development teams is directly related to **team maturity**."

Ricardo Britto, Darja Smite, Lars-Ola Damm, ***Software Architects in Large-Scale Distributed Projects: An Ericsson Case Study****, IEEE Software, November 2016.*[998]

[998] DOI: 10.1109/MS.2016.146

“Owing to the increasing amount of **computation** in **electromechanical devices**, the role of **software architect** is often found in **embedded-systems** development. However, because computer scientists usually have limited knowledge of **embedded-systems concepts** such as **controllers**, **actuators**, and **bu**ses, embedded-software architects are often engineers with no education in software architecture basics, which is normally a topic in computer science courses.”

Pablo Oliveira Antonino, Andreas Morgenstern, Thomas Kuhn, ***Embedded-Software Architects: It’s Not Only about the Software****, IEEE Software, November 2016.*[999]

[999] DOI: 10.1109/MS.2016.142

"**Software architects** don't just design architecture components or champion architecture qualities; they often must guide and **harmonize** the entire **community of project stakeholders**. The **community-shepherding** aspects of the architect's role have been gaining attention, given the increasing importance of complex 'organizational rewiring' scenarios such as DevOps, open source strategies, transitions to agile development, and corporate acquisitions"

Damian A. Tamburri, Rick Kazman, Hamed Fahimi, ***The Architect's Role in Community Shepherding****, IEEE Software, November 2016.*[1000]

[1000] DOI: 10.1109/MS.2016.144

"As software systems have evolved, so has software architecture, with practices growing to meet each era's new challenges. The next phase of evolution–**intelligent connected systems**–promises to be an exciting time for **software architects**."

Eoin Woods, ***Software Architecture in a Changing World****, IEEE Software, November 2016.*[1001]

[1001] DOI: 10.1109/MS.2016.149

"**High-maintenance code** not only is verbose but also tends to rely on unstated, poorly stated, or incompletely stated assumptions. If you want to understand that type of code, you need long chains of reasoning to figure out how and why it works, and under which conditions it could start failing when other parts of the system are updated. **The reliance on hidden assumptions** is probably the most telling feature of high-maintenance code."

---

*Gerard J. Holzmann, **Hi Maintenance**, IEEE Software, November 2016.*[1002]

“New wiring transformed **ENIAC** into a versatile stored-program computer. **Rewiring Internet of Things infrastructures** into a **general-purpose computing fabric** can similarly change how modern computation interfaces with our environment.”

Diomidis Spinellis, ***Software-Engineering the Internet of Things***, *IEEE Software, January 2017.*[1003]

[1003] DOI: 10.1109/MS.2017.15

"The proper **alignment of requirements engineering and testing** (RET) can be key to software's success. Three practices can provide effective RET alignment: using **test cases** as requirements, harvesting **trace links**, and **reducing distances** between requirements engineers and testers."

Elizabeth Bjarnason, Markus Borg, ***Aligning Requirements and Testing: Working Together toward the Same Goal****, IEEE Software, January 2017.*[1004]

[1004] DOI: 10.1109/MS.2017.14

"No consolidated set of software engineering **best practices** for the **Internet of Things (IoT)** has yet emerged. Too often, the landscape resembles **the Wild West**, with unprepared programmers putting together IoT systems in ad hoc fashion and throwing them out into the market, often poorly tested. In addition, the academic sector is in danger of fragmenting into specialized, often unrelated research areas."

Xabier Larrucea, Annie Combelles, John Favaro, Kunal Taneja, ***Software Engineering for the Internet of Things****, IEEE Software, January 2017.*[1005]

[1005] DOI: 10.1109/MS.2017.28

"The **Internet of Things (IoT)** is a challenging combination of **distribution and heterogeneity**. A number of software engineering solutions address those challenges in isolation, but few solutions tackle them in combination, which poses a set of concrete challenges. The **ThingML** (Internet of Things Modeling Language) approach attempts to address those challenges."

Brice Morin, Nicolas Harrand, Franck Fleurey, ***Model-Based Software Engineering to Tame the IoT Jungle****, IEEE Software, January 2017.*[1006]

[1006] DOI: 10.1109/MS.2017.11

"Despite the progress in **Internet of Things (IoT)** research, a general software engineering approach for systematic development of IoT systems and applications is still missing. A synthesis of the state of the art in the area can help frame the **key abstractions** related to such development."

Franco Zambonelli, ***Key Abstractions for IoT-Oriented Software Engineering***, *IEEE Software, January 2017.*[1007]

[1007] DOI: 10.1109/MS.2017.3

“**Mission-critical Internet of Things (MC-IoT)** systems involve heterogeneous things from both the **digital and physical worlds**. They run applications whose failure might cause significant and possibly **dramatic consequences**, such as interruption of public services, significant business losses, and deterioration of enterprise operations. These applications require not only high **availability**, **reliability**, **safety**, and **security** but also **regulatory compliance**, **scalability**, and **serviceability**. At the same time, they’re exposed to various facets of uncertainty, spanning from software and hardware variability to mission planning and execution in possibly unforeseeable environments. **Model-driven engineering** can potentially meet these challenges and better enable the adoption of MC-IoT systems.”

Federico Ciccozzi, Ivica Crnkovic, Davide Di Ruscio, Ivano Malavolta, Patrizio Pelliccione, Romina Spalazzese,

Model-Driven Engineering for Mission-Critical IoT Systems,

IEEE Software, January 2017.[1008]

[1008] DOI: 10.1109/MS.2017.1

"A roadmap from today's cloud-centric, data-centric IoT systems to the **Programmable World** highlights the technical challenges that deserve to be part of developer education and deserve deeper investigation beyond those IoT topics that receive the most attention today."

Antero Taivalsaari, Tommi Mikkonen, ***A Roadmap to the Programmable World: Software Challenges in the IoT Era****, IEEE Software, January 2017.*[1009]

[1009] DOI: 10.1109/MS.2017.26

"**Microservices** are in many ways **a best-practice approach** for realizing **SOA**."

Cesare Pautasso, Olaf Zimmermann, Mike Amundsen, James Lewis, Nicolai Josuttis, ***Microservices in Practice, Part 1: Reality Check and Service Design****, IEEE Software, January 2017.*[1010]

[1010] DOI: 10.1109/MS.2017.24

"Just as physicists infer dark matter's presence on the basis of its gravitational effects on visible matter, we can conceptualize a '**darkitecture**' that outlines visible software architectures."

Balaji Prasad, ***Darkitecture: The Reality Skirted by Architecture****, IEEE Software, January 2017.*[1011]

[1011] DOI: 10.1109/MS.2017.7

"**Computer games** are rich, complex, and often large-scale software applications. They're a significant, interesting, and often compelling domain for innovative research in software engineering techniques and technologies. **Computer games** are progressively changing the everyday world in many positive ways. Game developers, whether focusing on entertainment market opportunities or game-based applications in nonentertainment domains such as education, healthcare, defense, or scientific research (that is, serious games), thus share a common interest in how best to engineer game software."

Walt Scacchi, ***Practices and Technologies in Computer Game Software Engineering****, IEEE Software, January 2017.*[1012]

[1012] DOI: 10.1109/MS.2017.20

“‘What is **Infrastructure as code**? There are a lot of ways to answer that. One is that automation is the “CALM” of DevOps. CALM stands for **culture, automation, learning, and measurement**. Infrastructure as Code is about the automation piece. That’s how people who have been doing DevOps for a while approach it, using tools like Chef, Puppet, Ansible, and SaltStack. The philosophy behind this is that infrastructure has become like data: the physical layer has been abstracted. It’s **become software**, as opposed to being a physical thing. We can use infrastructure tools the same way we use software. We can **bring in best practices from software development**, such as continuous integration CI, test-driven development, and continuous delivery CD version control systems, and apply them to managing our infrastructure. “

Sven Johann, ***Kief Morris on Infrastructure as Code***, *IEEE Software, January 2017.*[1013]

"Although intensive research on **software analytics** has been going on for nearly a decade, a repeated complaint in software analytics is that industrial practitioners find it **hard to apply the results** generated from data science."

Ye Yang, Davide Falessi, Tim Menzies and Jairus Hihn, ***Actionable Analytics for Software Engineering****, IEEE Software, January 2018.*[1014]
